Re: Site Investigation Report (SIR) Addendum
642 Allens Avenue
Providence, Rhode Island
RIDEM Case No. 98-004 / Site Remediation File No. SR-28-1152

Dear Mr. Martella:

On behalf of The Narragansett Electric Company (TNEC) d/b/a Rhode Island Energy¹ (RI Energy) GZA GeoEnvironmental, Inc. (GZA) is pleased to present to the Rhode Island Department of Environmental Management (RIDEM) the attached *Site Investigation Report (SIR) Addendum* for the Former 642 Allens Avenue Manufactured Gas Plant (MGP) located at 642 Allens Avenue in Providence, Rhode Island (the Site).

The activities described in the attached report were performed in general accordance with the February 2014 *Supplemental Site Investigation Work Plan (SSIWP)*, as well as July 2021 and December 2022 *Replacement Monitoring Wells Installation Work Plans*, prepared by GZA on behalf of TNEC and submitted to RIDEM. This *SIR Addendum* presents a comprehensive evaluation of data and other information collected to date to address the applicable requirements of Section 1.8 of the Rules and Regulations for the Investigation and Remediation of Hazardous Materials Releases (Remediation Regulations 250-RICR-140-30-1). This *SIR Addendum* also includes an evaluation of remedial action alternatives to satisfy the requirements of Section 1.8.4 and presents the preferred remedial action alternative to achieve compliance with the Remediation Regulations. With the submittal of this report addendum, we believe that the Site Investigation activities for the Site are complete, and we request that a Program Letter is issued for the Site. Should you have any questions or comments regarding the information presented herein, please do not hesitate to contact the undersigned or Amy Willoughby from RI Energy at 401-258-5410.

Very truly yours,

GZA GEOENVIRONMENTAL, INC.

Sara Haupt, P.E.
Project Manager

Margaret S. Kilpatrick, P.E.
Principal

James J. Clark, P.E.
Consultant/Reviewer

Attachment: *SIR Addendum*

cc: Amy Willoughby, RI Energy
Robin Main, Hinckley Allen

¹ The Narragansett Electric Company d/b/a National Grid transitioned to The Narragansett Electric Company d/b/a Rhode Island Energy on May 24, 2022. For clarity, this report references The Narragansett Electric Company as Owner of the Site for the time period of early 2006 to present day.

Appendix AA Site Background

1.0 INTRODUCTION

On behalf of The Narragansett Electric Company (TNEC) d/b/a Rhode Island Energy (RI Energy), GZA GeoEnvironmental Inc. (GZA) has prepared this *Site Investigation Report Addendum (SIR Addendum)* describing activities performed at the Former 642 Allens Avenue Manufactured Gas Plant (MGP) located at 642 Allens Avenue in Providence, Rhode Island (refer to Figure 1 (*Title Sheet and Index to Drawings*) which presents the Site Locus Plan). The Site is also defined as Providence Tax Assessors Plat (A.P.) 101 Lot 1 and A.P. 56 Lot 5, 273, 316 and 317. These properties are collectively referred to herein as the “Site.”

This *SIR Addendum* presents a summary of environmental investigations performed at the Site dating back to 1994. In addition, this report presents the results of investigations related to data gaps that were identified in the February 2014 *Supplemental Site Investigation Work Plan (SSIWP)*, as well as the July 2021 and December 2022 *Replacement Monitoring Wells Installation Work Plans*, which were submitted to the Rhode Island Department of Environmental Management (RIDEM) Office of Land Revitalization and Sustainable Materials Management (OLRSMM; formerly the Office of Waste Management (OWM)).

This report includes a summary of the Site’s history, a description of the environmental setting and a summary of the findings and conclusions from previous reports and recent investigations consistent with Section 1.8.3 of the Rules and Regulations for the Investigation and Remediation of Hazardous Materials Releases (250-RICR-140-30-1). In addition, this report includes an evaluation of remedial alternatives and the selection of a preferred alternative for the Site consistent with Section 1.8.4 of the *Remediation Regulations*. This report, together with previous submissions to RIDEM, serves as the SIR for this Site. With the submittal of this report addendum, we believe that the Site Investigation activities for the Site are complete, and we request that a Program Letter is issued for the Site.

This *SIR Addendum* includes data/information previously presented in the following reports/documents:

- *Site Characterization Report* prepared by Resource Controls Associates (RCA) on behalf of the Providence Gas Company (PGC) dated July 1994;
- *Summary Report – Phase 1A Field Investigations* prepared by RCA on behalf of the PGC dated February 1995;
- *Condensate Tank Closure Status Report and Remedial Action Plan for Compressor Building No. 2* prepared by RCA on behalf of PGC dated February 1995;
- *Underground Storage Tank (UST) Closure Assessment* prepared by Hoffman Engineering, Inc. (HEI) on behalf of the PGC dated October 1995;
- *Summary Report – Phase 1B Field Investigations* prepared by RCA on behalf of the PGC dated June 1996;
- *Remedial Action Report for Short Term Measure Performed at the Providence Gas Company* prepared by RCA on behalf of PGC dated June 1996;
- *UST Closure Assessment* prepared by HEI on behalf of the PGC dated September 1998;
- *Remedial Action Work Plan (RAWP)* prepared by Environmental Science Services (ESS) prepared on behalf of the PGC dated December 1998;
- *Subsurface Investigation and Proposed Remediation Algonquin Generator Construction Area* prepared by ESS on behalf of the PGC dated October 1999;

- *Summary Letter* prepared by PGC dated May 2001;
- *Modified RAWP* prepared by Vanasse Hangen Brustlin (VHB) on behalf of the New England Gas Company (NEGC) dated November 2001;
- *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC dated November 2002;
- *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC dated December 2002;
- *SIR* prepared by VHB on behalf of the NEGC dated April 2003;
- *Oxide Box Waste Summary Memo* prepared by VHB on behalf of TNEC dated January 2009;
- *Construction Completion Report for Demolition and Decommissioning of Gasholders Nos. 18 and 21* prepared by Brown and Caldwell on behalf of TNEC dated July 2010;
- *Soil Management Plan (SMP)* prepared by GZA on behalf of TNEC dated September 2012;
- *Summary of September 2012 Sinkhole and Washout Areas Repair Activities* prepared by GZA on behalf of TNEC dated February 14, 2013;
- *Summary Letter Report – Temporary On-site Treated Groundwater Discharge Permit* prepared by GZA on behalf of TNEC dated May 23, 2013;
- *Summary of Hoxie Run Natural Gas Line Upgrade Activities* prepared by GZA on behalf of TNEC dated December 12, 2013;
- *Supplemental Site Investigation Work Plan* prepared by GZA on behalf of TNEC dated February 2014;
- *Summary of LNG Water Line Upgrade Activities* prepared by GZA on behalf of TNEC dated November 6, 2014;
- *Summary of Gas Line Repair Soil and Groundwater Management Activities* prepared by GZA on behalf of TNEC dated October 15, 2015;
- *Groundwater Monitoring Reports:*
 - *Groundwater Monitoring Report – 2003 to 2005* prepared by VHB on behalf of TNEC dated December 2005;
 - *Groundwater Monitoring Report – 2008* prepared by VHB on behalf of TNEC dated June 2008;
 - *Groundwater Monitoring Report – 2009* prepared by GZA on behalf of TNEC dated February 2010;
 - *Groundwater Monitoring Report – 2010* prepared by GZA on behalf of TNEC dated August 2010;
 - *Groundwater Monitoring Report – January to June 2011* prepared by GZA on behalf of TNEC dated July 2011;
 - *Groundwater Monitoring Report – July to December 2011* prepared by GZA on behalf of TNEC dated September 2012;
 - *Groundwater Monitoring Report – 2012* prepared by GZA on behalf of TNEC dated August 2013;
 - *Groundwater Monitoring Report – 2013* prepared by GZA on behalf of TNEC dated September 2014;

- *Groundwater Monitoring Report – 2014 through 2017* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Monitoring Report – 2018* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Monitoring Report – 2019* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Monitoring Report – 2020* prepared by GZA on behalf of TNEC dated February 2021;
- *Groundwater Monitoring Report – 2021* prepared by GZA on behalf of RI Energy dated September 2022; and
- *Groundwater Monitoring Report – 2022* prepared by GZA on behalf of RI Energy dated June 2023.
- Holder 18/21 Capping Project:
 - *Short Term Response Action Plan (STRAP) – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC dated April 2016;
 - *STRAP Addendum – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC dated May 2016;
 - *Short Term Response Action Approval Letter* issued by RIDEM to TNEC dated May 18, 2016; and
 - *STRAP Completion Report – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC dated April 2017.
- Dike Access Road Project:
 - *STRAP – Dike Access Road* prepared by GZA on behalf of TNEC dated June 2016;
 - *STRAP Addendum – Dike Access Road* prepared by GZA on behalf of TNEC dated August 2016;
 - *Short Term Response Action Approval Letter* issued by RIDEM to TNEC dated August 25, 2016;
 - *STRAP Addendum – Holcim Driveway* prepared by GZA on behalf of TNEC dated May 2017; and
 - *STRAP Completion Report – Dike Access Road Project* prepared by GZA on behalf of TNEC dated February 7, 2020.
- Liquefaction Project:
 - *STRAP – Proposed Liquefaction Project* prepared by GZA on behalf of National Grid LNG LLC (NG LNG LLC) dated May 2017;
 - *STRAP Addendum – Proposed Liquefaction Project* prepared by GZA on behalf of NG LNG LLC dated October 11, 2017;
 - *Short Term Response Action Approval Letter* issued by RIDEM to NG LNG LLC dated October 27, 2017; and
 - *Short Term Response Action Closure Report* prepared by GZA on behalf of NG LNG LLC dated March 21, 2023.
- PIP:
 - *PIP Process Initiation Letter* from RIDEM to TNEC dated September 2016;
 - *PIP* prepared by GZA on behalf of TNEC dated October 2016;

- *PIP* prepared by GZA on behalf of TNEC dated May 2017;
- *PIP Comment Letter* from RIDEM to TNEC dated June 2017;
- *Response to Comments – PIP* prepared by GZA on behalf of TNEC dated June 2017;
- *Final PIP* prepared by GZA on behalf of TNEC dated June 2017; and
- *Public Involvement Plan Approval Letter* issued by RIDEM to TNEC dated June 28, 2017.

This report and its conclusions are subject to the Limitations presented in Appendix A (*Limitations*) and are subject to modification if subsequent information is developed by GZA or any other party.

In accordance with Section 1.8.8 of the Remediation Regulations, a completed Site Investigation Submission Checklist is included in Appendix B (*SIR Checklist*).

Note, this report presents information obtained from borings completed by RI Energy or their predecessors for geotechnical, structural or civil engineering purposes. As most of these boring logs have not been provided to the Department in previous submittals, logs that are referenced herein are provided in Appendix C (*Historical Geotechnical Boring Logs*).

1.1 PROJECT OBJECTIVES

The Site was the location of the Former 642 Allens Avenue MGP and is listed as a “State Site” under RIDEM’s Remediation Regulations (RIDEM Case No. 98-004 / File No. SR-28-1152). In February 2014, GZA, on behalf of TNEC, submitted a *SSIWP* to RIDEM with the objective of completing the Site investigation consistent with the Remediation Regulations. The primary objective of the February 2014 *SSIWP* was to collect supplemental Site data necessary to complete the following:

- Investigate data gaps identified in the February 2014 *SSIWP*;
- Further characterize the nature and extent of impacted soil;
- Further characterize groundwater quality at the Site;
- Compare soil and groundwater data to applicable RIDEM criteria;
- Further characterize Non-Aqueous Phase Liquid (NAPL) impacts;
- Identify potential exposure pathways and receptors; and
- Complete the requirements of a Site Investigation in accordance with RIDEM’s Remediation Regulations.

The investigation activities presented in this *SIR Addendum* were performed in general accordance with the *SSIWP*. Any deviations from the work plans were relatively minor and did not affect the generated data or the conclusions of this report.

Please note that this *SIR Addendum* is intended to supplement the *SIR* prepared by VHB on behalf of the NEGC and submitted in 2003.

1.2 REPORT ORGANIZATION

This *SIR Addendum* is organized in the following manner:

- This section (Section 1.00) provides an introduction to the project and a brief description of the Site Investigation (SI) program;
- Section 2.00 presents a background of the Site and adjoining properties and describes the current condition and the environmental setting of the Site, a summary of Site history information and outlines potential sources of impact from former operations, a summary of the regulatory history of the Site, the results of previous Site investigations and previous remedial actions that have been completed;
- Section 3.00 describes the SI program in detail and provides the results of a quality assurance/quality control evaluation on the resulting data; and a comprehensive evaluation of each data gap with both historical and recently collected data. Given the current and foreseeable Site setting and use, soil and groundwater data were compared to the applicable RIDEM Method 1 GB Groundwater Objectives, the GB-Leachability Criterion and the Industrial/Commercial Direct Exposure Criteria (I/C-DEC). In addition, this section includes a summary of the annual groundwater monitoring reports, as well as monitoring well decommissioning and reinstallation activities completed at the Site;
- Section 4.00 describes the remedial response actions completed at the Site;
- Section 5.00 provides an overview of the nature and extent of observed soil and groundwater impacts. As extensive Site investigation activities have been completed at the Site and documented in previous submittals to RIDEM, this section is intended to be an overview of Site conditions;
- Section 6.00 describes the conceptual Site model (including potential migration and exposure pathways) and outlines potential receptors to identified impacts;
- Section 7.00 outlines the remedial objectives for the Site;
- Section 8.00 identifies three remedial action alternatives and presents the comparative evaluation which was performed to facilitate selection of the preferred alternative;
- Section 9.00 presents the rationale for selection of the preferred remedial alternative;
- Section 10.00 presents the proposed interim groundwater monitoring program;
- Section 11.00 presents a preliminary remedy implementation schedule; and,
- Section 12.00 contains the report Certification per the Remediation Regulations.

2.0 SITE BACKGROUND INFORMATION

The following sections provide a summary of relevant background information for the Site. This information was obtained from earlier reports and the Site reconnaissance performed as part of investigations conducted between 2014 and 2016 and annual groundwater and site monitoring activities from 2016 through 2022. Additional background information can be found in Appendix AA.

2.1 SITE LOCATION, GENERAL DESCRIPTION AND CURRENT USE

The Site was the location of the 642 Allens Avenue Former MGP. The Site is now largely occupied with natural gas utility operations, which serve the City of Providence and the State of Rhode Island. The Site is located on the east side of Allens Avenue, northeast of the intersection of Allens Avenue and Terminal Road in the City of Providence, Rhode Island (refer to

Figure 1 (*Title Sheet and Index to Drawings*) which presents the Site Locus Plan). The majority of the Site is secured with a locked perimeter chain-link fence. The configuration of this perimeter fencing is shown on Figure 3A (*Existing Conditions Plan – Western Side of the Site*) and Figure 3B (*Existing Conditions Plan – Eastern Side of the Site*).

The Site is identified in the City of Providence Tax Assessor's Office as Assessors Plat (A.P.) 56, Lots 5, 273, 316, and 317, and as A.P. 101, Lot 1. The Site consists of approximately 41-acres of land. The entirety of the Site is currently owned by TNEC d/b/a RI Energy. National Grid LNG, LLC (NGLNG, LLC) holds a lease on A.P. 56 Lot 316 and LaFarge Holcim US, Inc. (Holcim) holds a lease on A.P. 56 Lot 273. The entirety of the Site is zoned by the City of Providence as W-3 (Port/Maritime Industrial Waterfront District). The W-3 Port/Maritime Industrial Waterfront District is intended “to promote maritime industrial and commercial uses within the areas of Providence's waterfront, protect the waterfront as a resource for water-dependent industrial uses, and facilitate the renewed use of a vital waterfront”. The current Site layout and key features are shown on Figures 3A and 3B.

For the purpose of this report, the Site has been subdivided into three areas based on current use. Figures 3A and 3B present the location and configuration of the following areas:

- Natural Gas Regulation Facility (portion of A.P. 101 Lot 1 and A.P. 56 Lot 5);
- Liquefied Natural Gas (LNG) Facility (A.P. 56 Lot 316); and
- Holcim Cement Facility (A.P. 56 Lots 273 and 317).

The following table summarizes the five parcels that make up these three Site areas. Parcel locations are also shown on Figures 3A and 3B.

| A.P. | Lot | Lot Size (Acres) | Current Owner | Address | Current Use(s) |
|------|-----|------------------|---------------|--|---|
| 101 | 1 | 11.35 | TNEC | 642 Allens Avenue 670 Allens Avenue | Natural Gas Construction Storage Natural Gas Regulation and Distribution |
| 56 | 5 | 8.90 | TNEC | 642 Allens Avenue | Natural Gas Construction Storage Natural Gas Regulation and Distribution |

2.1.1 EASEMENTS

The following table summarizes existing Site easements, the majority of which are for utility access and maintenance. The location of the easements is shown on Figures 3A and 3B.

| Date | Grantor | Grantee | Present Lot No. | Book (Bk.) and Page | Notes |
|------|--|----------------------------|-----------------|-------------------------|---|
| 1905 | Now or Formerly (N/F) Charles Morris Smith and George M. Smith | N/F PGC | A.P. 101 Lot 1 | Bk. 470 Pages 224 – 229 | Now owned by the City of Providence as conveyed in Book 514 Pages 338-342. Easement is held for railroad tracks that cross the property |
| 1916 | N/F PGC | N/F the City of Providence | A.P. 101 Lot 1 | Bk. 561 Pages 326 – 328 | Easement is held for the Ellis Street Sewer Line that crosses the Site in the Natural Gas Regulator Facility. |

| Date | Grantor | Grantee | Present Lot No. | Book (Bk.) and Page | Notes |
|------|--------------------|--|----------------------------------|--------------------------|--|
| 1961 | N/F PGC | N/F TNEC and the New England Telephone and Telegraph Company | A.P. 56 Lots 273 and 317 | Bk. 1111 Pages 752 – 756 | Easement is held for access to electric and telephone poles in the Holcim Cement Facility and the LNG Facility. |
| 2002 | N/F Southern Union | N/F Narragansett Bay Commission (NBC) | A.P. 101 Lot 1 and A.P. 56 Lot 5 | Bk. 5249 Pages 219 – 322 | Easement is for a large subsurface tunnel used for stormwater management by NBC. Easement is a permanent subsurface easement approximately 70 feet in width and 120 feet in height beginning at different elevations depending on the depth of the tunnel (at least 90 feet below current grade) |

The above table was compiled as a result of a file review conducted at the City of Providence City Clerk’s office and should not be considered to be an official title search. Other easements may exist.

2.2 ADJOINING AREA AND PROPERTY USE

The Site consists of approximately 41 acres with frontage on Allens Avenue to the west and bounded to the east by the Providence River. It is adjoined to the northwest by Motiva/Texaco, and to the south by Terminal Road, the Former Sun Oil/Providence Port facility, and New England Bituminous Terminal Corporation. Figure 4 (*Overall Aerial Site Plan*) presents the location of the Site and these abutting lots. The area bounding the Site is industrial in nature, with parcels zoned W-3 or M-2 (both industrial type zoning). The nearest residential lot is located over 1,000 feet to the south of the Site. The following table presents a summary of abutting parcels and their current use:

| Direction | Tax Assessor’s Plat and Lot | Current Owner | Zoning | Current Use |
|-----------|-----------------------------|--|--------|---|
| North | A.P. 55 Lot 429 | N/F Algonquin LNG, Inc. ² | W-3 | Vacant – Water Lot |
| North | A.P. 55 Lot 196 | N/F Motiva Enterprises (Motiva) | W-3 | Oil and Gas Storage and Distribution |
| West | A.P. 101 Lot 493 | N/F Motiva Enterprises | M-2 | Oil and Gas Storage and Distribution |
| South | A.P. 101 Lot 497 | N/F City of Providence | W-3 | Municipal – Department of Public Works Building |
| South | A.P. 56 Lot 331 | N/F City of Providence | W-3 | Railroad Tracks and Terminal Road |
| Southeast | A.P. 56 Lot 327 | N/F Univar, Inc. | W-3 | Chemical Storage and Distribution |
| Southeast | A.P. 56 Lot 348 | N/F New England Petroleum Terminal LLC | W-3 | Oil and Gas Storage and Distribution |
| Southeast | A.P. 56 Lot 6 | N/F Hudson Terminal Corp | W-3 | Asphalt Storage and Distribution |
| Southeast | A.P. 56 Lot 271 | N/F Glen Falls Lehigh Cement Co | W-3 | Cement Storage and Distribution |

² Please note that this water lot is not considered to be part of the Site. Algonquin LNG, Inc. (predecessor to National Grid LNG LLC) acquired this lot in 1972 for the purposes of a proposed expansion but never operated on this lot. The proposed expansion was not completed. A letter of responsibility (LOR) was issued for the Site in 1998, under LOR #98-004. The Site is defined in the LOR as A.P. 56, Lots 5, 273, 316, and 317, and as A.P. 101, Lot 1. The water lot (A.P. 55 Lot 429) is not considered to be part of the Site as defined by RIDEM.

2.3 ENVIRONMENTAL JUSTICE (EJ) FOCUS AREAS

Based on review of information presented in the Environmental Resource map maintained by RIDEM (<http://www.dem.ri.gov/maps/>), the Site is located within the 2022 Draft Environmental Justice Area. Rhode Island Energy acknowledges that the 2022 Environmental Justice Area is draft and will take effect once finalized. Per the Environmental Justice requirements, enhanced public communications are required for projects in these areas. The Site is subject to a Public Involvement Plan (PIP) dated June 9, 2017, which outlines public communication protocols that are currently being performed for the Site which fulfills the requirements of the *Environmental Justice Policy*, Version 1.3, dated September 25, 2023 <https://dem.ri.gov/sites/g/files/xkgbur861/files/2022-06/ridem-environmental-justice-policy.pdf>. Details of the PIP are discussed in Section 2.6. Per the conditions of the PIP, a public notice will be performed upon completion of Site Investigation Activities.

2.4 SOIL MANAGEMENT PLAN

A SMP was established for the Site and submitted to RIDEM on September 12, 2012³ (based in part on the 2009 SMP prepared by VHB and the 2010 SMP prepared by GZA). The SMP established procedures for soil screening/disposal requirements, soil stockpile management and erosion controls, odor controls, dust controls, capping requirements, decontamination protocols equipment leaving the Site, requirements for import of soils, basic dewatering guidelines and management of non-soils (such as asphalt or concrete). The SMP is similar to what would be recorded with an Environmental Land Usage Restriction (ELUR) and has been utilized at the Site for numerous facility projects (such as fence post installation, geotechnical investigation work, utility emergency work, smaller facility projects under previously installed engineered caps, and other critical utility infrastructure work).

Perimeter air monitoring has also been conducted on a project-by-project basis. The following engineered controls were utilized as described in **Appendix G** to control respirable dust and odors as needed during these projects:

- Dust control measures were employed to mitigate the potential for release of airborne particulate matter beyond the limits of the Site perimeter in accordance with RIDEM Air Pollution Control Regulation No. 5, Fugitive Dust. Methods of dust control consisted of sprinkling the ground surface with water and/or calcium chloride, covering of temporary stockpiles and mulching; and
- Odor control measures were employed to mitigate the potential for release of odors beyond the limits of the Site perimeter in accordance with RIDEM Air Pollution Control Regulation No. 17, Odors. Methods of odor control consisted of backfilling excavations and covering stockpiles or excavations with 6-mil polyethylene sheeting.

Each project was restored with an engineered cap. Figure 8 depicts the existing engineered caps and controls located at the Site. Sixty-seven (67) projects have been conducted under the SMP between September 2012 and December 2022. Details regarding these projects is included in **Appendix G**.

2.5 STRAP ACTIVITIES

Several facility projects have been initiated / completed under *STRAPs* approved by RIDEM. The table below provides a summary of these projects. Background of each *STRAP* is provided in Section 4.00.

³ The 2012 SMP will be updated once a Program Letter is received for the Site.

| Project | Figure Ref. | Summary of Project | Regulatory Submittals to RIDEM OLRSM | RIDEM OLRSM Approval Date | Date Work Completed | STRA Completion Report submitted to RIDEM OLRSM |
|-------------------------------|-------------|--|---|--|---------------------------------|---|
| Holder 18/21 Capping Project | 4A / 7 | Capping of 4.63 acres in the Natural Gas Regulating Facility | STRAP – April 27, 2016 STRAP Addendum – May 10, 2016 | May 18, 2016 | August 8, 2016 – March 31, 2017 | April 27, 2017 |
| Dike wall Access Road Project | 4B / 7 | Capping of approximately 39,000 square feet (SF) (0.90 acres) of the Site for a new facility access road for the LNG Facility. | STRAP – June 29, 2016 STRAP Addendum – August 22, 2016 | August 25, 2016 | August 31, 2016 – January 2020 | February 7, 2020 |
| | 4B | Capping of approximately 12,000 SF (0.28 acres) of the Site for a new facility access road for the Holcim Cement Facility. | STRAP Addendum – May 30, 2017 | TNEC tenant chose to not pursue project. Closed. | | |
| Liquefaction Project | 4B | Capping of approximately 3.45 acres of the Site for a liquefaction facility at the LNG Facility. | STRAP – May 12, 2017 | October 27, 2017 | February 2023 | March 21, 2023 |

2.6 PUBLIC INVOLVEMENT PLAN (PIP)

On September 6, 2016, RIDEM informed TNEC that RIDEM OWM received a formal request for development of a PIP with a *PIP Process Initiation Letter*. GZA, on behalf of TNEC, submitted the PIP to RIDEM OWM on October 28, 2016. A revised PIP was submitted to RIDEM on May 4, 2017. After responding to comments issued by RIDEM on June 2, 2017, the PIP was finalized on June 9, 2017. RIDEM issued a *Public Involvement Plan Approval Letter* on June 28, 2017.

Consistent with the Remediation Regulations, and specifically Section 1.8.7, the PIP was prepared to address relevant and applicable requirements of Section 1.8.7 A through D of the Remediation Regulations. Per Section 1.8.7 (Public Involvement), the PIP addresses the following primary elements: 1) Public Notice, 2) Fact Sheets and Enhanced Communication, 3) Community Meetings, and 4) Information Repositories.

RIDEM established a website to serve as a document repository for the Site:
<http://www.dem.ri.gov/programs/wastemanagement/site-remediation/Providence-Gas-Co.php>.

In addition, RI Energy maintains a public document repository at Knight Memorial Library located at 275 Elmwood Avenue, Providence, RI 02907.

The PIP is not intended to apply to projects involving limited subsurface disturbance associated with construction activities or those located in areas previously capped consistent with RIDEM requirements. In addition, this plan does not apply to work

necessary to maintain day-to-day operations at existing facilities or facility emergencies, including repairs and maintenance of the natural gas regulating facility, liquefied natural gas facility, and cement distribution facility. This plan also does not apply to projects involving minor soil disturbances only (e.g., utility work, installation of fence posts, etc.). For these activities, RI Energy will follow the soil and groundwater management procedures for the Site set forth in the September 2012 *SMP*.

3.0 SUMMARY OF ENVIRONMENTAL INVESTIGATIONS (1994 – 2022)

Previous investigations have been performed at the Site by various firms dating back to 1994. These Site investigations have been documented in reports submitted to RIDEM. Investigations included extensive drilling, test pitting, soil sampling and groundwater sampling. The following reports were prepared to present results of Site investigation activities:

- *Site Characterization Report* prepared by RCA on behalf of the PGC dated July 1994;
- *Summary Report – Phase 1A Field Investigations* prepared by RCA on behalf of the PGC dated February 1995;
- *Summary Report – Phase 1B Field Investigations* prepared by RCA on behalf of the PGC dated June 1996;
- *RAWP* prepared by ESS prepared on behalf of the PGC dated December 1998;
- *Subsurface Investigation and Proposed Remediation Algonquin Generator Construction Area* prepared by ESS on behalf of the PGC dated October 1999;
- *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC dated November 2002;
- *SIR* prepared by VHB on behalf of the NEGC dated April 2003; and
- *Oxide Box Waste Summary Memo* prepared by VHB on behalf of TNEC dated January 2009.

A summary of each previously completed investigation effort is included in **Appendix D** (*Summary of Completed Investigations (1994 through 2002)*). For further information related to previous Site investigations, please refer to the reports previously referenced. Please note that sampling depths described in the discussion in **Appendix D** are from the original grades during sampling at the Site. Portions of the Site have been remediated and capped and relative sampling depths are unknown. Additionally, the discussion of environmental impacts presented herein pertains only to material remaining at the Site following remedial activities based on GZA's review of available information.

As part of the SIR, GZA reviewed data presented in these previous reports and identified data gaps. The following sections describe the Supplemental Site Investigation program that was completed at the Site between 2014-2016, annual groundwater monitoring rounds, and monitoring well replacement activities.

3.1 SUPPLEMENTAL SITE INVESTIGATION PROGRAM AND RESULTS (2014-2016)

The primary project objective of the Supplemental Site Investigation (Supplemental SI) program performed by GZA was to collect additional subsurface information to address identified data gaps and to support the development of an applicable and appropriate remedial strategy for the Site.

SCOPE OF WORK

The scope of the *SSI/WP* was completed between May 2014^{4,5} and December 2016 and consisted of the tasks described below.

- Performance of twenty-six (26) additional soil borings across the Site to further characterize the nature and extent of previously identified soil and groundwater impacts. Twenty-three (23) of the soil borings were completed as groundwater monitoring wells. Soil samples were collected continuously during the performance of the borings. The samples were collected for soil classification, observation for the presence of environmental impacts, and field-screening. Select surface (defined herein as collected at a depth of between 0 and 2 feet bgs) and/or subsurface (defined herein as collected at a depth of greater than 2 feet bgs) soil samples (nineteen (19) samples and two (2) blind duplicates) from the explorations were also submitted for analytical testing for volatile organic compounds (VOCs) using EPA Method 8260, total petroleum hydrocarbons (TPH) using EPA Method 8100M, PAHs using EPA Method 8270, and EPA 13 Priority Pollutant Metals (PP-13 Metals) using EPA Methods 6010B and 7471A. Select subsurface soil samples were also submitted for TPH fingerprinting analysis using a modified EPA Method 8015B. The majority of subsurface soil samples were collected from the vadose zone (above the water table).
- Performance of four (4) soil borings (performed via soil vacuum excavation) in the Former Oxide Box Area to further characterize the nature and extent of previously identified soil impacts. Soil samples were collected from the sidewalls of these borings. The samples were collected for soil classification, observation for the presence of environmental impacts, and field-screening. Select surface and subsurface soil samples (four (4) samples and one (1) blind duplicate) from the explorations were also submitted for analytical testing for VOCs using EPA Method 8260, TPH using EPA Method 8100M, semi-volatile organic compounds (SVOCs) using EPA Method 8270, RCRA-8 Metals using EPA Methods 6010B and 7471A, toxicity characteristic leaching procedure (TCLP) Lead via EPA Method 1311, polychlorinated biphenyls (PCBs) using EPA Method 8082 and reactivity. Each subsurface soil sample was collected from the vadose zone (above the water table).
- Performance of one (1) test pit explorations to further characterize the extent of NAPL impacts proximate to RCA-21. Soil samples were collected during the performance of the test pits for classification, observation for the presence of environmental impacts, and field-screening. A recovery well (RW-1) was installed to replace RCA-21.
- Collection of ten (10) surficial soil samples to further characterize lead impacts proximate to Former Gasholders that were located on Site. The samples were submitted for analytical testing for lead using EPA Method 6010B and TCLP lead via EPA Method 1311. Additionally, one (1) blind duplicate sample was submitted for analysis of lead using EPA Method 6010B and TCLP lead via EPA Method 1311. Five (5) of the ten (10) surficial soil samples were submitted for analysis of Synthetic Precipitation Leaching Procedure (SPLP) lead via EPA Method 1311.

⁴ In accordance with Section 1.8.7 of the *Remediation Regulations*, GZA identified and subsequently provided notifications to the abutting property owners, tenants and easement holders that environmental investigations were being performed at the Site. The abutter notifications were sent out on May 13, 2014. A list of abutting Site property owners and a copy of the notification has been provided to RIDEM and is attached as Appendix J (*May 13, 2014 Abutter Notification*).

⁵ As indicated on Figures 3A and 3B, portions of the Site are within 200-feet of a coastal feature (the Providence River), and as such, the Supplemental SI activities were subject to the jurisdiction of the CRMC. To address CRMC requirements, GZA prepared an April 7, 2014 "Finding of No Significant Impact" (FONSI) application associated with the performance of the Supplemental SI program, as outlined in February 2014 *SSI/WP*. In response to our application, the CRMC issued an April 8, 2014 FONSI (F2014-04-022) that stipulated project work must be completed within 3-years. A copy of the CRMC permit is provided in Appendix K (*CRMC Permit F2014-04-022 – Site Investigation Activities*).

- Collection of seven (7) trip blank soil samples. Each trip blank sample was submitted for analysis of VOCs using EPA Method 8260B.
- Collection of forty (40) groundwater samples from seventeen (17) existing monitoring wells and twenty-three (23) newly installed monitoring wells in August 2014. Prior to sampling, the wells were evaluated for the presence of LNAPL and DNAPL using an electronic oil/water interface probe. Groundwater samples were submitted for analysis of VOCs using EPA Method 8260B. Additionally, two (2) blind duplicates and three (3) trip blanks were submitted for analysis of VOCs using EPA Method 8260B.
- Collection of twenty-one (21) groundwater samples in October 2015. Prior to sampling, the wells were evaluated for the presence of LNAPL and DNAPL using an electronic oil/water interface probe. Groundwater samples were analyzed for VOCs using EPA Method 8260B. Additionally, two (2) blind duplicates and two (2) trip blanks were submitted for analysis of VOCs using EPA Method 8260B.
- Collection of twenty-one (21) groundwater samples in May 2016. Prior to sampling, the wells were evaluated for the presence of LNAPL and DNAPL using an electronic oil/water interface probe. Groundwater samples were analyzed for VOCs using EPA Method 8260B. Additionally, two (2) blind duplicates and two (2) trip blanks were submitted for analysis of VOCs using EPA Method 8260B.
- Collection of periodic (at least semi-annually) depth to groundwater and NAPL measurements of the wells, with NAPL recovery evaluations (if detected).
- Periodic observations of the riverfront area for the presence of sheens or other evidence of impact. These observations were conducted on an approximate monthly basis.
- Preparation of this *SIR Addendum* which summarizes the recently collected data and previously collected data in reference to data gaps.

3.1.1 DATA GAPS

The following data gaps were identified based on a review of the findings of the reports referenced previously and remedial actions performed to date. The scope of work presented above was designed to specifically address these data gaps.

SITE PERIMETER

Limited investigations have been completed along the northern and western property line / Site boundary. Those that have been performed consist primarily of shallow Geoprobe® borings (completed to the depth of the observed water table). Additional investigations are required to further evaluate the lateral and/or vertical extent of impacts. NAPL has been observed at certain locations along the property line (for example, CB-01, CB-02 and MH-01; refer to Figure 5A) that are not consistent with historical use and/or on-Site groundwater flow patterns. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

DRAINAGE REHABILITATION AREA

As described below, sheen / product was identified in catch basin structures and the conveyance piping servicing the northwestern portion of the Site. Results of forensic testing indicated that the sheen was determined to be comprised of complex mixtures of variably weathered petroleum, with the major component being “middle distillate petroleum” (i.e., diesel fuel, or #2 fuel oil). The source of this sheen / product is unknown. NAPL has not been historically detected in nearby monitoring wells (RCA-1 or VHB-1), which are located directly to the south of the catch basin structures and the conveyance piping.

Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

NATURAL GAS LEAK REPAIR AREA

As described below, sheen was observed in the excavation associated with the natural gas piping repair proximate to the Former Booster House; refer to Figure 5A. The sheen was identified to be comprised of “primarily heavy middle distillate” (e.g., cutting oil, light lubricating oil, or gear oil), with low levels of pyrogenic PAHs. The source of this sheen is unknown. The investigations performed to date may not fully characterize the extent of NAPL in this portion of the Site. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

LEAD UCLS

Four surface soil samples collected directly proximate to Former Gasholders Nos. 18 and 21 exceeded the total lead RIDEM Upper Concentration Limits (UCL) of 10,000 mg/kg. The location of the two Gasholders is shown on Figure 5A. The two Gasholders were decommissioned and demolished in 2010, as documented in the July 2010 *Construction Completion Report for Decommissioning and Demolition of Gasholders #18 and #21, Allens Avenue, Former MGP, Providence, Rhode Island* prepared by Brown and Caldwell on behalf of TNEC, as described below. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

COVE AREA

Limited investigations have been completed along the cove that is proximate to the northern portion of the Site. The investigations which have been completed were primarily shallow Geoprobe® borings (typically less than 10 feet in depth) and may not have fully vertically delineated the extent of impacts. Sheen observations have been observed at mid and low tide since at least 1996 (as documented in the 1996 *Phase II Field Characterization Investigation*, as referenced above). The cove is directly proximate to an area referred to as the “seep area”. In 1996, several remedial actions were completed in the area to address the source of the sheens, as documented in the 1996 *Phase II Field Characterization Investigation* prepared by RCA and in 2002 as documented in the November 2002 *Remedial Action Closure Report* prepared by VHB. These remedial actions included the completion of significant excavation upland of the “seep area” to address Former historical structures and potential sources of the observed sheens in the cove area. This area of the Site had several active MGP structures from 1910 to at least 1954.

As documented in the annual groundwater monitoring reports since 2011, sheens, generally consisting of bright bands, are generally observed in the area of the cove between the corresponding upland locations of CHES RW-3 and CHES RW-5 (refer to Figure 5B). GZA inspects the area of the cove for sheens at least once per month and GZA inspected the cove daily during the Fields Point Liquefaction Project. Based on GZA’s observations, sheens are generally observed at mid to low tide each day. In June 2013, a sheen sample was collected by GZA personnel during a monitoring event and was submitted to New Fields Analytical Laboratory of Rockland, Massachusetts for fingerprint analysis. Results identified the sheen sample as “mixed petroleum oil tar and parking lot runoff.” The laboratory report from New Fields Laboratory is included in **Appendix O** (noted as June 26, 2013 New Fields Chemical Fingerprinting Summary Letter and Analytical Report).

As noted in the August 2013 *Groundwater Monitoring Report* prepared by GZA on behalf of TNEC, LNAPL has only been detected in CHES RW-4 in trace to 0.03 feet thickness; this recovery well is located in the area between CHES RW-2 and CHES RW-5. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

OXIDE BOX AREA

VHB on behalf of TNEC submitted to RIDEM a memo entitled *Oxide Box Waste Summary Memo* presenting a summary of investigations performed in the area, analytical testing results and recommended remedial approach for the former oxide box area located in the southern portion of the natural gas regulating facility (immediately east of the former gasholders). GZA performed additional investigation to supplement the January 2009 investigation performed by VHB. As part of the investigation, certain soil samples collected from the test pits were analyzed for various disposal parameters. The remedial approach recommended by VHB included excavation of the upper 1 foot of surface soil within the entire former oxide box area, excavation of a localized area of subsurface soil where impacts above the GB Leachability Criteria were detected (i.e., sample location B-08), and backfilling the deeper excavation with material from the Material Handling Area (MHA) stockpile. Following placement of the MHA material as backfill to approximately 1 foot below grade, a geotextile would be placed in the excavation area and the remaining excavation would then be backfilled to grade with clean off-Site imported fill. It was estimated that approximately 1,730 CY or 2,700 tons of excavated soil would require off-Site transport and disposal at a licensed receiving facility. VHB stated that based on reactive cyanide and reactive sulfide testing of soil sample VHB-TP102(6'), the soil generated during the proposed remedial efforts would likely be accepted by ESMI of Loudon, New Hampshire for thermal desorption. It should be noted that this soil sample was characterized as a "black sand with a strong MGP-like odor" and exhibited a total volatile organic compounds (TVOC) headspace screening of greater than 2,500 parts per million by volume (ppmv). No evidence of blue and/or green staining was noted in this sample; however, observations of "dark green... gray/blue stained... wood chips" was noted in soil samples from the proposed deeper excavation area by VHB. Given the nature of the material proposed to be excavated for off-Site disposal, the existing analytical data may not fully characterize the material for disposal at ESMI. As such, supplemental characterization is proposed in order to further assess excavation volumes and soil management options. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

MONITORING WELL RCA-3

Monitoring well RCA-3 is located in the north-central portion of the Site proximate to the cove, as shown on Figure 4B. Dense Non-Aqueous Phase Liquid (DNAPL) was identified in RCA-3 during 2011, 2012 and 2013 in trace amounts. The existing monitoring well may not characterize the vertical extent of DNAPL in the area. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

MONITORING WELL RCA-21 LNAPL

Monitoring well RCA-21 is located on the LNG portion of the property, as shown on Figure 5B. RCA-21 was installed in 1996 by RCA as part of the Phase 1B Site Investigation activities. Remedial activities were completed in this area during 2001 and are documented in the November 2002 *Remedial Action Closure Report* prepared by VHB. LNAPL was detected in thickness ranging from 0.07 to 3.58 feet between 2011 and 2014. Monthly field monitoring visits performed between 2011 and 2014 that Light Non-Aqueous Phase Liquids (LNAPL) at this well was readily recoverable, suggesting a possible localized source. According to historical plans for the Site, RCA-21 was not located within the footprint of any existing structures. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. A comprehensive evaluation of data collected in this area is presented below.

DEEPER SITE INVESTIGATION

In general, environmental explorations completed at the Site have generally been shallow, extending to depths of approximately the water table (generally 4 to 8 feet bgs). As such, information pertaining to the vertical extent of impacts in some areas of the Site is limited. Of note, several monitoring wells were installed by VHB in 2002 in borings that may have not fully characterized the vertical extent of potential impacts. These include borings/wells VHB-1 (near CB-01), VHB-7 (northwest of LNG operations buildings), VHB-10 (southwest of Former Gasholder No. 18) and VHB-21 (proximate to the natural gas regulator), as shown on Figure 5A. Review of the boring logs at each of these locations indicates that the presence of "strong" odors and/or

“separate phase product, oil saturated” soil conditions at the bottom of the borings (ranging in depths from 12 to 14 feet). Based on these observations, supplemental test borings/monitoring wells are recommended to assess and delineate the vertical extent of impacts at these three locations.

In addition, several rounds of geotechnical borings have been completed for various project upgrades in the eastern portion of the Site. The logs were reviewed for general indicators of environmental impacts. Several locations were identified with possible impacts at depth: proximate to RCA-3, proximate to the Former Compressor Building No. 1 near VHB -7, proximate to the LNG vaporizer building near ESS RW-3, 4, 5, and 6 and proximate to the LNG generator area near VHB-20; refer to Figure 5A. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of deeper impacts. A comprehensive evaluation of data collected in this area is presented below.

3.1.2 SOIL AND GROUNDWATER EXPLORATION PROGRAM

The following sections describe the exploration and analytical testing program completed between 2014 and 2016. This field program involved the completion of thirty (30) soil borings (26 drive and wash and 4 vacuum excavation), with twenty-three (23) of the borings completed as groundwater monitoring wells to evaluate groundwater quality and the presence of NAPL. This investigation program also included the performance of one (1) test pit and the collection of ten (10) surficial soil samples. Samples collected below 2 feet bgs are referred to as subsurface soils. Exploration locations are shown on Figures 5A and 5B.

This section presents GZA’s interpretation of the data in terms of the nature and extent of impact, including the distribution of RIDEM Method 1 exceedances. This exceedance comparison considered the current environmental setting and use of the property. Under current and foreseeable future conditions, the Site would likely continue operation as an industrial facility owned by TNEC (industrial/commercial use). Accordingly, the data were compared to the RIDEM Method 1 GB Groundwater Objectives, the GB-Leachability Criteria, and the I/C-DEC. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons described below and summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Soil and groundwater samples were also collected and analyzed during the investigation program in accordance with the February 2014 *SSIWP*. The explorations and the analytical testing program were designed to investigate the data gaps described above. For a comprehensive summary of quantitative analytical testing results and measurements collected during the Supplemental SI study, please refer to the attached Tables 1 through 12.

Note that groundwater analytical data was included in previous groundwater monitoring reports submitted to RIDEM. Please refer to those reports for more information (see Section 1.00 for listing).

SOIL BORINGS AND FIELD SCREENING

In 2014, GZA observed the installation of thirty (30) soil test borings by Geologic Earth Exploration, Inc. of Norfolk, Massachusetts. The majority of the soil borings were advanced using cased (wash and drive) drilling techniques. In addition, each of the borings were initially advanced using vacuum excavation to depths of approximately 6 feet bgs or the water table for utility clearance purposes. Four (4) borings were advanced using vacuum excavation only (GZ-321S to GZ-324S).

All soil borings extended to 30 to 36 feet bgs, with the exception of certain shallow (*i.e.*, GZ-316D, GZ-317D, and GZ-321S to GZ-324S). Refusal was encountered at depths of 6.5 feet bgs and 5.5 feet bgs, respectively, at borings GZ-316D and GZ-317D. GZ-321S to GZ-324S were completed to collect additional subsurface soil samples only. The deep multi-level borings (identified with a “D” suffix to the boring identification number) extended to at least 10 feet into “clean soils”⁶. The shallow multi-level borings were identified with an “S” suffix to the boring identification number. Soil samples were obtained continuously during the

⁶ “Clean soils” for the purposes of this report were defined as the lack of visual and/or olfactory observations and/or field screening results.

advancement of the borings⁷ at approximately 2-foot intervals with a 2-inch split-spoon sampler and a 140-pound hammer. Groundwater monitoring wells were installed in twenty-three (23) of the thirty (30) borings as described below.

A GZA field engineer was present during all exploration activities to coordinate and document subsurface conditions, classify soils, prepare boring logs, field-screen soil samples and collect/prepare samples for laboratory testing. Visual observations of impacted soils were noted on the boring logs in accordance with the following soil classification key:

Sheen - Iridescent petroleum-like sheen.

Stained - Used with color (*i.e.*, black or brown stained) to indicate that the soil matrix is stained a color other than the natural (non-impacted) color.

Coated - Soil grains are coated with free product however there is not sufficient free phase material present to saturate the pore spaces.

Blebs - Discrete sphericals of free product were observed but for the most part the soil matrix was not visibly contaminated or saturated. Typically, this is residual product.

Saturated - The entirety of the pore space of a sample occupied by free product (rather than groundwater). Depending on viscosity, free phase saturated materials may freely drain from a soil sample.

Petroleum or Oil - Used to characterize free and/or residual product that exhibits a distinct fuel oil or diesel fuel-like odor.

Tar - Used to describe free and/or residual product that exhibits a distinct "coal tar" type odor (*e.g.*, naphthalene-like odor). Weathered tars may not exhibit an odor and are identified on a visual basis. Colors of product can be brown, black, reddish-brown, or gold.

Solid Tar - Used to describe product that is solid or semi-solid phase. The magnitude of the observed solid tar is described (*e.g.*, discrete granules or a solid layer) in the boring logs.

Purifier Material- Purifier materials are commonly identified by their distinctive blue/green color. Other colors may be present including indigo (deep blue) or brown/rust. Typically purifier materials contain wood chips, oyster or clam shells or granular material. The material may have a distinctive sulfur-like odor when freshly exposed to air.

Coal Ash /Clinker - Odorless, grey or black in color. Clinker may exhibit glazing.

GZA personnel photo-documented the soil within each split spoon sampler during the advancement of each boring. Copies of the photos have not been included as an appendix to this report but can be provided upon request. Please refer to the boring logs attached in **Appendix L (GZA 2014 Exploration Logs)** for a description of subsurface conditions and monitoring well construction details.

The soil from each sampling interval was placed in clean, 8-ounce glass jars. Soil samples for VOC analysis were placed in 40 milliliter (ml), methanol-preserved glass vials with septa caps. All recovered soil samples were stored in a cooler with ice and transported under chain-of-custody protocols to ESS Laboratory in Cranston, Rhode Island. Soil samples not selected for laboratory analysis were stored in a freezer by ESS Laboratory for potential subsequent analysis and/or disposal.

All soil samples recovered during the program were screened in the field for TVOCs with a MiniRAE Photo-Ionization Detector (PID) equipped with a 10.6 eV lamp and jar-head space technique prior to placing on ice. The MiniRAE PID measures relative levels of

⁷ Soil samples were not collected from the shallow wells adjacent to deep groundwater monitoring wells RCA-12R, GZ-302S, GZ-303S, GZ-312S, and GZ-314S since soil samples were collected continuously during the advancement of the deep wells.

TVOCs referenced to an isobutylene in-air-standard. Although the PID screening cannot be directly used to quantify VOC concentrations or to identify individual compounds, the results can serve as a relative indicator of VOC levels. The TVOC screening results are provided on the boring logs in **Appendix L**.

Upon achieving the desired depth, each boring (not slated for monitoring well installation) was backfilled with clean drill cuttings and/or clean filter sand to a depth approximately coincident with the existing ground surface.

Drilling equipment was decontaminated between each test boring within a dedicated decontamination area located to the northeast of Former Compressor House No.2. Wash water (*i.e.*, decontamination water), excess drilling water and soil cuttings generated during drilling were placed into 55-gallon drums for subsequent off-Site disposal. The resulting drums were labeled and temporarily stored on-Site. All investigation derived wastes (IDWs) were transported off-Site by Clean Harbors Environmental Services (CHES) to their facility in Braintree, Massachusetts.

SOIL SAMPLE LABORATORY ANALYSES

Soil samples were collected from each boring exploration for potential analytical testing. Nineteen (19) subsurface soil samples were submitted for laboratory testing from the soil borings during this supplemental investigation program. Additionally, two (2) blind duplicates were submitted for analysis. Soil samples were submitted for laboratory analysis for VOCs using EPA Method 8260, TPH using EPA Method 8100M, PAHs using EPA Method 8270, PP13 Metals using EPA Methods 6010B and 7471A, and total cyanide using EPA Method 9010C. In accordance with the February 2014 *SSIWP*, soil samples were selected for laboratory analysis based on field screening results, visual observations and gaps in the analytical database. The samples were collected in non-preserved 8 oz. glass containers with Teflon lids as well as in 40-ml methanol-preserved glass vials with septa caps. All soil samples were packed in an ice chest and transported under chain-of-custody protocol to ESS Laboratory in Cranston, RI. A copy of the soil boring analytical results and chain-of-custody forms are presented in **Appendix M** (*Laboratory Report – Soil Samples*) and the analytical results are summarized in Table 1 (*Summary of Soil VOC Analytical Results*), Table 2 (*Summary of Soil TPH, PAHs and Inorganic Analytical Results*), Table 7 (*Summary of Soil QA/QC VOC Analytical Results*) and Table 8 (*Summary of Soil QA/QC TPH, SVOCs, PCBs and Inorganics Analytical Results*).

Four (4) soil samples were submitted from the vacuum excavated soil borings completed in the Oxide Box Area to further characterize the subsurface soils in this area. Additionally, one (1) blind duplicate was submitted for analysis. Soil samples were submitted for laboratory analysis for VOCs using EPA Method 8260, TPH using EPA Method 8100M, SVOCs using EPA Method 8270, RCRA-8 Metals using EPA Methods 6010B and 7471A, PCBs using EPA Method 8082A, TCLP Lead via EPA Method 1311 and total cyanide using EPA Method 9010C. In accordance with the February 2014 *SSIWP*, soil samples were selected for laboratory analysis based on field screening results, visual observations and data gaps in the analytical database. The samples were collected in non-preserved 8 oz. glass containers with Teflon lids as well as in 40-ml methanol-preserved glass vials with septa caps. All soil samples were packed in an ice chest and transported under chain-of-custody protocol to ESS Laboratory in Cranston, RI. A copy of the soil boring analytical results and chain-of-custody forms are presented in **Appendix M** (*Laboratory Report – Soil Samples*) and the analytical results are summarized in Table 5 (*Summary of Oxide Box Soil VOC Analytical Results*), Table 6 (*Summary of Oxide Box Soil TPH, PAHs and Inorganic Analytical Results*), Table 7 (*Summary of Soil QA/QC VOC Analytical Results*) and Table 8 (*Summary of Soil QA/QC TPH, SVOCs, PCBs and Inorganics Analytical Results*).

Thirteen (13) soil samples were submitted from explorations on Site for analysis of TPH fingerprint via EPA Method 8015B. In accordance with the February 2014 *SSIWP*, soil samples were selected for laboratory analysis based on field screening results, visual observations and data gaps in the analytical database. The samples were collected in non-preserved 8 oz. glass containers with Teflon lids. All soil samples were packed in an ice chest and transported under chain-of-custody protocol to Alpha Analytical Laboratory in Mansfield, MA. A modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentration ($C_8 - C_{44}$). A high-resolution gas chromatogram produced by this method provides a detailed “fingerprint” of the hydrocarbons that compose samples. This analysis allowed for the characterization of the general boiling range(s) and type(s) of petroleum or other hydrocarbons present in the samples, as well

as the degree(s) of weathering a fugitive product has undergone in the environment. New Fields Laboratory (New Fields) presented and discussed the results in their July 24, 2014 Chemical Fingerprinting Summary Letter and Analytical Report. The letter also included the analytical results and chain-of-custody forms. The July 24, 2014 Letter is included in **Appendix O** (*New Fields Chemical Fingerprinting Results*). The analytical results are summarized in Table 3 (*Summary of Soil TPH Fingerprinting Results*).

Quality control and quality assurance (QA/QC) samples were also collected and analyzed during the Supplemental SI program. These QA/QC procedures and samples are summarized in Section 3.1.3 and **Appendix N** (*Summary of Soil and Groundwater QA/QC Results*). The QA/QC results are summarized in Table 7 (*Summary of Soil QA/QC VOC Analytical Results*) and Table 8 (*Summary of Soil QA/QC TPH, SVOCs, PCBs and Inorganics Analytical Results*).

MONITORING WELL INSTALLATIONS

Twenty-three (23) new monitoring wells were installed during the Supplemental SI program to further investigate data gaps and further evaluate groundwater quality and the nature and extent of NAPL at the Site. The shallow and deep wells were constructed of 2-inch Schedule 40 PVC in accordance with the standards specified in Appendix 1 of the RIDEM Groundwater Quality Regulations. Ten (10) of the wells consisted of shallow wells with screens set to span the natural water table encountered during drilling (typically within the fill unit). The remaining thirteen (13) wells consisted of deep wells extended into “clean soils”, equipped with a 10-foot screen section set near the bottom of the boring at least 30 feet bgs. For both the deep and shallow wells, a sand filter pack was installed in the annular space around the well screen and extended approximately 1 foot above the well screen. The well screen lengths of the water table wells varied from approximately 10 to 15 feet. An approximate 1-foot (minimum) bentonite seal was placed above the filter pack. The remaining borehole above the bentonite was backfilled with clean native drill cuttings (when encountered) or clean filter sand. No impacted soil was used as backfill to construct the monitoring wells. A concrete surficial seal with an approximate 3-foot long, steel protective casing or a protective road box was installed to protect the wells. No glue or cement was used in the construction of any of the wells. For additional detail, please refer to the boring/well installation logs in **Appendix L** (*GZA 2014 Exploration Logs*).

Upon completion of the monitoring well installations, the wells were allowed to stabilize over a minimum 1-week period prior to well development. Well development activities were completed between June 13th and 16th, 2014. The newly installed wells and all available pre-existing wells that were sampled during the June 2014 sampling round were developed to remove sediment build-up. This process was performed by surging a bailer repeatedly the length of the well screen followed by the removal of at least ten (10) standing water column volumes or the removal of water added during drilling. Groundwater was removed via a combination of bailing and pumping techniques. During development, GZA monitored the turbidity of the extracted water to evaluate the effectiveness of the development activities. Well development continued until the water quality was reasonably non-turbid or until the minimum purge volume was achieved. A summary of these results is included in the 2014-2017 monitoring report.

All development water was collected in 55-gallon drums for subsequent off-Site disposal. The drummed purge water was transported off-Site for appropriate disposal by CHES at their Braintree, Massachusetts facility. Copies of shipping records are included in the 2014 – 2017 Monitoring Report dated January 2021.

TEST PITTING

On June 17, 2014, GZA observed the performance of a test pit (TP-301) by CHES with the objective of further characterizing the extent of LNAPL at monitoring well RCA-21 (shown on Figure 5B). The test pit was performed with a track-mounted excavator and extended to a depth of approximately 13 feet bgs, with an approximate area of 50 SF. Prior to the performance of the test pit, temporary erosion control measures consisting of straw wattles were installed on the topographic downgradient side. The excavated soil was temporarily staged adjacent to the excavation on two layers of poly sheeting for subsequent re-use as backfill.

A recovery well was installed in TP-301. The recovery well consisted of 12-inch diameter high density polyethylene (HDPE) pipe set at approximately 13 feet bgs, with a 5-foot perforated screen section set between 8 and 13 feet bgs and non-perforated HDPE pipe set from 8 feet bgs to 2 feet above ground surface. The recovery well was backfilled around the perforated screen section with ¾-inch crushed stone and the excavated soil was subsequently used to backfill the test pit in approximately the same sequence as removed; that is, the last material removed was the first material replaced. The backfill was compacted with the bucket of the excavator in successive lifts.

The bucket of the excavator was decontaminated prior to leaving the Site within the previously discussed dedicated decontamination area. The decontamination water was collected and transferred into a 55-gallon drum. All IDW was transported off-Site by CHES to their facility in Braintree, Massachusetts, or another certified facility. Copies of shipping records for the IDWs were included in the 2014-2017 Monitoring Report.

A GZA field engineer was present during the test pit to document subsurface conditions, classify soils, prepare a test pit log, and field-screen soil samples. Soils classification and field screening was conducted in the same manner as described above. The test pit log associated with TP-301 is included in **Appendix L** (*GZA 2014 Exploration Logs*).

SURFACE SOIL SAMPLING AND LABORATORY ANALYSIS

On July 1, 2014, GZA collected ten (10) surface soil samples (SS-301 through SS-310) to investigate a data gap in the Former Gasholder area. The surface soil samples were collected using a shovel from the upper 1 foot of soil (0-1 feet). The shovel was decontaminated between each sampling location using a mixture of deionized (DI) water and Alconox, followed by a rinsing with clean deionized water. A summary table in **Appendix L** (*GZA 2014 Exploration Logs*) summarizes the surface soil sampling information for the SS-300 series completed by GZA, including sample description, location and observations of olfactory and/or visual evidence of impacts, which was conducted in the same manner as described above.

Each surface sample from the SS-300 series was submitted for laboratory analysis for total lead using EPA Method 6010B and TCLP lead using EPA Method 1311. Additional soil was collected from five (5) of the surface soil sample locations in July 2015 for analysis of SPLP lead using EPA Method 1311. The samples were collected in non-preserved 8 oz. glass containers with Teflon lids. All soil samples were packed in an ice chest and transported under chain-of-custody protocol to ESS Laboratory. A copy of the analytical results and chain-of-custody forms are presented in **Appendix M** (*Laboratory Reports – Soil Samples*) and Table 4 (*Summary of Surface Soil Sampling Lead Sampling*).

Quality control and quality assurance (QA/QC) samples were also collected and analyzed during the Supplemental SI program. These QA/QC procedures and samples are summarized in Section 3.1.3 and **Appendix N**. The QA/QC results are summarized in Table 8 (*Summary of Soil QA/QC TPH, SVOCs, PCBs and Inorganics Analytical Results*).

GROUNDWATER DEPTHS AND ELEVATIONS

Following completion of the well installations in June 2014, GZA recorded periodic depth to groundwater readings in each of the available monitoring wells using an electronic water level indicator. GZA also surveyed the vertical elevation of the top of the PVC well casing and adjacent ground surface for each new and existing well relative to the North American Vertical Datum of 1988 (NAVD 1988). These depths to groundwater readings and reference elevations were used to calculate the elevation of the groundwater table at each well location. Monitoring well reference elevation and depth to groundwater measurements are presented in Table 9, *Summary of Groundwater and NAPL Gauging Results*. Table 9 also includes groundwater elevation data collected by GZA since July 2011 during initial assessment of well conditions at the Site.

NAPL GAUGING AND RECOVERY

During the groundwater gauging events completed by GZA since July 2011, measurements of the presence and thickness of NAPL were also recorded. NAPL measurements were gauged using an oil-water interface probe. To gauge the presence of

LNAPL, the probe was lowered into the well until the probe's continuous alarm indicated the presence of LNAPL. When the probe passes through the product into groundwater, an intermittent alarm is triggered. This information was used to gauge the thickness of LNAPL. Gauging for the presence of DNAPL was conducted in the same manner as the LNAPL. Once the continuous alarm of the interface probe was heard, measurements were taken to the bottom of the well to record product thickness. Due to the material's physical properties, an accurate assessment of NAPL thickness is typically difficult and this method of measurement likely leads to an overestimation of both LNAPL and DNAPL thicknesses.

Between July 2011 and December 2022, LNAPL was present in seventeen (17) monitoring wells ranging from a trace/sheen (<0.01 feet) up to 3.58 feet of product in well RCA-21⁸. DNAPL was encountered in one (1) monitoring well (RCA-3) in trace amounts only. The results of these NAPL gauging activities are summarized in Table 10 (*Historical LNAPL Well Gauging Data*), and Table 11 (*Historical DNAPL Well Gauging Data*). These are estimated thicknesses of NAPL in the wells, which may not be reflective of actual subsurface conditions.

Between July 2011 and December 2022, an evaluation of NAPL recoverability was also made at a subset of the wells where NAPL was present (RCA-21 and RCA-29). LNAPL recovery was performed with a peristaltic pump with dedicated tubing positioned directly below the top of the LNAPL surface. The LNAPL was extracted from the well until groundwater was observed within the tubing at which point the pump was deactivated. The recovery of the LNAPL was then monitored with an oil/water interface probe. A summary of these results is included in the groundwater monitoring reports; see Section 1.00 for list of reports.

Any recovered LNAPL was collected and containerized in labeled 55-gallon drums for off-Site disposal. All IDW was transported off-Site by CHES to their facility in Braintree, Massachusetts, or another certified facility. Copies of shipping records for the IDWs generated during the Supplemental SI program were included in the groundwater monitoring reports; see Section 1.00 for list of reports.

GROUNDWATER SAMPLING AND ANALYSIS

Between 2014 and 2016, the groundwater monitoring well network consisted of seventy-four (74) groundwater monitoring wells (51 existing wells and 23 new wells). Three rounds of groundwater samples were collected from the monitoring well network as part of this Supplemental SI investigations. The first groundwater sampling round was performed between June 16th and 20th, 2015 and included the collection of groundwater samples from forty (40) monitoring wells (twenty-three (23) samples from newly installed monitoring wells and seventeen (17) samples from existing monitoring wells). The second groundwater sampling round was performed between October 14th and 19th, 2015 and included the collection of twenty-one (21) groundwater samples. The third groundwater sampling round was performed between May 18th and 21st, 2016 and included the collection of twenty-one (21) groundwater samples.

Groundwater samples were collected in general accordance with EPA's January 19, 2010 *Low Stress (low flow) Purging and Sampling Procedure* (Low Flow SOP). Prior to sampling, the depth to static groundwater and NAPL present was measured in each well using an ORS electronic oil/water interface probe. During groundwater sampling, a variable speed peristaltic pump was utilized to control the rate of purging. Dedicated 1/4-inch polyethylene tubing installed in each of the wells was utilized as the intake and discharge tubing for the pump. This tubing has the potential to become brittle when exposed to UV light (sunlight) and where necessary this tubing was replaced with new dedicated tubing as indicated on the field sampling logs. Groundwater sampling logs are included in the 2014-2017 Monitoring Report. Pharmaceutical grade tubing was utilized as the pump head tubing and connected to the intake and discharge tubing by clamps sufficient to prevent the introduction of air into the sample. If NAPL was noted in the monitoring well prior to sampling, new tubing was installed in the monitoring well. In order to limit the potential for LNAPL to enter the sampling tubing during the collection of the sample, a peristaltic pump was used to force air

⁸ LNAPL thicknesses present in RCA-21 was considered a data gap for the Site. As part of the 2014 investigation activities, a test pit was conducted at the location and a recovery well was installed to aid in LNAPL recovery. Additional information is presented in Section 3.1.8.8.

through the tubing as it passed through the LNAPL/groundwater interface. If DNAPL was noted in the well, the sampling tubing was installed in these wells carefully so that the DNAPL layer was not intercepted.

During sampling, field readings were recorded for pH, temperature, specific conductance, oxidation reduction potential (ORP) and dissolved oxygen (DO) using a YSI Professional Plus® portable water quality meter with a flow-through cell. A LaMotte Turbidimeter® was used to monitor the turbidity. These field readings are presented in the field sampling logs, attached to the 2014-2017 Monitoring Report. As indicated on the logs, the monitoring wells were pumped until field screening parameters were stabilized prior to collecting the samples.

Samples were placed in laboratory-provided, hydrochloric acid-preserved 40 mL glass vials with septa caps for VOC analysis via EPA Method 8260B. Samples were then packed in an ice chest and transported under chain-of-custody protocol to ESS Laboratory located in Cranston, Rhode Island. A summary of these results is included in the 2014-2017 groundwater monitoring report.

SHEEN / WATERFRONT OBSERVATIONS (2012-2022)

GZA has been performing periodic inspections of conditions along the cove area adjacent to the Site along the Providence River since 2012. During these periodic inspections, we have made observations as to the presence of sheens along the shoreline. Most of the inspections were performed at, or close to, low tide. However, some of the inspections were performed during other stages of the tidal cycles to evaluate conditions throughout the cycle. Sheen observations from 2012 through 2022 were documented in annual groundwater sampling reports submitted to RIDEM (see **Appendix E**). Table 12 presents the sheen / waterfront observations observed by GZA between 2012 and 2022.

3.1.3 QUALITY ASSURANCE/QUALITY CONTROL PROCEDURES AND SAMPLES

All sample collection, handling, storage, field screening methods, transportation, and analyses were conducted in general accordance with the *SSIWP* to ensure that results are accurate and representative. In addition and as described below, in accordance with the *SSIWP*, GZA collected and analyzed field duplicate samples and trip blanks.

The split spoon samplers were decontaminated between each sampling interval via scrubbing with an alkaline detergent/water mixture and a water rinse.

Field duplicate samples were collected and analyzed to evaluate the reproducibility of the sampling methods. With the exception of the VOC samples, duplicate soil samples were collected via homogenizing the sample interval and collecting aliquots of the homogenized soil for analysis. Duplicate VOC soil samples were collected directly from the split spoons prior to homogenization. Duplicate groundwater samples were collected sequentially after achieving stabilization of the geochemical parameters. Duplicate samples were collected at a frequency of 1 duplicate sample per 20 samples collected on average. Duplicate soil and groundwater sampling results are included in the applicable summary tables, with a reference to the applicable sample location in the table note section.

A VOC trip blank accompanied each cooler of soil and groundwater samples to the laboratory and was analyzed for the presence of VOCs to evaluate potential cross contamination during sample transport.

A copy of the soil analytical results and chain-of-custody forms are presented in **Appendix M** (Laboratory Reports – Soil Samples), Table 7 (*Summary of Soil QA/QC VOC Analytical Results*) and Table 8 (*Summary of Soil QA/QC TPH, SVOCs, PCBs and Inorganics Analytical Results*).

The following summarizes the soil and groundwater QA/QC samples for the project:

| QA/QC Sample Type | Matrix | Number | Analysis / Comment |
|-------------------|-------------|--------|--|
| Field Duplicates | Soil | 3 | VOCs, TPH, PAHs, PP-13 Metals, Total Cyanide |
| | | 1 | Total Lead, TCLP Lead |
| | | 3 | VOCs, TPH, RCRA-8 Metals, TCLP Lead, PCBs, SVOCs |
| Field Duplicates | Groundwater | 6 | VOCs |
| Trip Blanks | Soil | 7 | VOCs |
| Trip Blanks | Groundwater | 6 | VOCs |

Upon receipt, GZA audited the analytical data to assess whether the analytical data met the data quality objectives of the project. This audit included evaluation of QA/QC samples (e.g., Lab Control Samples/Lab Control Sample Duplicates, Method Blanks, Field Blanks, and Field Duplicates) to evaluate the representativeness, comparability, completeness, precision, accuracy, and sensitivity of the analytical data. An evaluation of the soil and groundwater data is presented in **Appendix N (Summary of Soil QA/QC Results)**.

In general, the soil and groundwater analytical results generally met the project data quality objectives.

3.1.4 DATA GAP SITE INVESTIGATION RESULTS

The following sections present a comprehensive evaluation of environmental data in the vicinity of each data gap described in above.

3.1.4.1 NORTHERN AND WESTERN SITE PERIMETER

Historically, this area was part of the Narragansett Bay and was gradually filled during the 19th century to current grades. No MGP operations were historically located along the western Site boundary or northwestern corner of the property. The majority of this area is not improved with an engineered cap, although a portion of the area is paved with asphalt. The purpose of this data gap evaluation was to provide a better understanding of environmental impacts along the perimeter of the Site, particularly with respect to observations of NAPL in this portion of the property.

Prior to the 2014 SSIWP work, limited investigations had been completed along the northern and western property line / Site boundary. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of impacts in this area. As part of the 2014 investigation, GZA completed twelve (12) additional soil borings (GZ-301D/RCA-12R, GZ-302S/D, GZ-303S/D, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-309D, GZ-310, GZ-311D and GZ-312S/D), installed nine (9) shallow monitoring wells (RCA-12R, GZ-301S, GZ-302S, GZ-303S, GZ-305S, GZ-306S, GZ-307S, GZ-308S and GZ-312S) and installed seven (7) deep monitoring wells (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D and GZ-312D) along the Site perimeter to further characterize the soil and groundwater impacts. Figure P-1 (*Exploration Location Plan*) in **Appendix P (Data Gap – Northern and Western Site Perimeter)** presents the limits of this data gap area, including the locations of previous explorations and those completed in 2014. The limits of this data gap area were generally defined as within 80 feet of the northern and western property line.

A total of sixty-eight (68) explorations (B-60, B-61, RCA-1, RCA-2, RCA-12, U-1, D84, D85, D86, D87, D88, D89, D90, D91, D92, D92, D93, D94, E84, E85, E86, E90, E91, F11, F23, F24, F25, F29W, F30, F31, F37, F39, F40, F41, F42, F43, F44, F45, F46, F47, F48,

F56, F57, Test Pit D87, Test Pit E86, Test Pit E91, Test Pit F41, Test Pit F56, VHB-1, VHB-3, VHB-5, VHB-14, VHB-15, VHB SS-1, VHB SS-7, VHB SS-8, GZ-301D/RCA-12R, GZ-302S/D, GZ-303S/D, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-309D, GZ-310, GZ-311D and GZ-312S/D) were previously performed in proximate to the northern and western property line⁹ to depths ranging from 6 to 52.5 feet bgs. These explorations are shown on the attached Figure P-1 in **Appendix P**. Fifteen (15) shallow monitoring wells (RCA-1, RCA-2, RCA-12, RCA-12R, VHB-1, VHB-3, VHB-5, GZ-302S, GZ-303S, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-312S and U-1) and seven (7) deep monitoring wells (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D and GZ-312D) were located in the area. Three (3) additional groundwater grab samples were collected from temporary monitoring wells installed in 2000. Five (5) monitoring wells (VHB-3, GZ-311D, GZ-312S, GZ-312D and U-1) were decommissioned in 2016 (as described below) and three (3) monitoring wells RCA-2, RCA-12 and VHB-5 were noted as destroyed prior to 2010. Boring and test pit logs are included in **Appendix P**.

The following sections provide a discussion of the extent of impacts along the northern and western property line/Site boundary (field screening and observations of impacted soils, soil impacts, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein. This data gap evaluation did not intend to evaluate impacts in the vicinity of the drainage structures located in the northwestern corner of the Site, although these areas overlap. The drainage rehabilitation area data gap is presented below.

Field Screening and Observations of Impacted Soils

A review of boring and test pit logs from the area indicates the presence of approximately 12 to 16 feet of fill underlain by organic silts, outwash deposits and glacial till (unknown thickness to bedrock). In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. Visual indicators of petroleum-like saturation were noted on the boring logs for B-60 (5-13 feet bgs), RCA-2 (6-8 feet bgs), D87 (2-6 feet bgs), E86 (2-6 feet bgs), F44 (6-10 feet bgs), Test Pit D87 (3.5-4 feet bgs), Test Pit E86 (2-6 feet bgs), VHB-1 (4-14 feet bgs), VHB-3 (12-14 feet bgs), VHB-5 (4-6 feet bgs), GZ-302D (10-12 feet bgs), GZ-307S (4-16 feet bgs), GZ-308S (4-6 feet bgs) and GZ-309D (10-14 feet bgs). Petroleum-like odors (also described as “oil-like”) were noted in most borings located in the Site perimeter area (RCA-2, D86, D87, D88, D90, D91, D92, E84, E85, E86, E91, F23, F39, F40, F41, F42, F44, F45, F46, F47, F48, F56, F57, Test Pit D87, Test Pit E86, VHB-1, VHB-3, VHB-5, GZ-302D, GZ-303D, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-309D, GZ-311D and GZ-312D). Petroleum-like odors were generally noted coincident with the water table (depths of approximately 6 to 14 feet bgs). Visual and olfactory evidence of coal tar-like impacts (sometimes noted as “asphaltic”) were noted in RCA-1 (6-16 feet bgs), Test Pit F41 (0.5-6 feet bgs), VHB-5 (6-10 feet bgs), VHB-15 (9-14 feet bgs), GZ-304D (9-16 feet bgs), GZ-306S (6-8 feet bgs), GZ-309D (8-16 feet bgs) and GZ-310 (6-10 feet bgs). Visual indicators of purifier box-like waste was noted in many borings in the area. Purifier box-like waste is identified with blue or green staining, the presence of wood chips and/or a cyanide or naphthalene-like odors. Indicators of purifier box-like waste was noted on the boring logs for D86 (4-6 feet bgs), F41 (0.5-7 feet bgs), F42 (6-10 feet bgs), VHB-5 (4-6 feet bgs) and GZ-310 (6-8 feet bgs). TVOCs readings from these borings ranged from non-detect (ND) to approximately 955 ppmv. Generally, TVOC readings increased with depth until approximately 2 feet below the water table and decreased thereafter.

Surface Soils

Surface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and inorganic compounds. A total of forty (40) samples were submitted for analysis. The compounds that were detected in excess of the RIDEM I/C-DEC were TPH (240 – 15,000 mg/kg), arsenic (1.7 – 27.3 mg/kg), lead (1.2 – 649 mg/kg), 2,4-Dinitrotoluene (14 mg/kg), Benzo [a] anthracene (0.19 – 330 mg/kg), Benzo [a] pyrene (0.2 – 220 mg/kg), Benzo [b] fluoranthene (0.19 – 340 mg/kg), Benzo [k] fluoranthene (0.19 – 150 mg/kg), Dibenzo [a,h] Anthracene (0.05 – 41 mg/kg) and Indeno [1,2,3-cd] Pyrene (0.14 – 100 mg/kg). TPH was the only compound detected in excess of the RIDEM GB Leachability Criteria (240 – 15,000 mg/kg). Table P-1 (*Surface Soil Data*) in **Appendix P** presents the analytical subsurface soil data collected in this area.

⁹ These explorations were also performed directly proximate to the drainage rehabilitation area.

Subsurface Soils

Subsurface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and inorganic compounds. A total of seventy-seven (77) samples were submitted for analysis.¹⁰ The compounds that were detected in excess of the RIDEM I/C-DEC were benzene (0.008 – 326 mg/kg), TPH (48.6 – 631,000 mg/kg), arsenic (4.2 – 81.9 mg/kg), lead (5.9 – 1,610 mg/kg), Benzo [a] anthracene (0.42 – 2,080 mg/kg), Benzo [a] pyrene (0.269 – 923 mg/kg), Benzo [b] fluoranthene (0.4 – 894 mg/kg), Benzo [k] fluoranthene (0.71 – 740 mg/kg), Chrysene (0.36 – 2,060 mg/kg), Dibenzo [a,h] Anthracene (0.211 – 205 mg/kg), Indeno [1,2,3-cd] Pyrene (0.586 – 382mg/kg) and Naphthalene (0.4 – 165,000 mg/kg). The compounds that were detected in excess of the RIDEM GB Leachability Criteria were benzene (0.008 – 326 mg/kg), toluene (0.0401 – 417 mg/kg) and TPH (48.6 – 631,000 mg/kg). Naphthalene was detected in excess of the RIDEM UCLs in the sample collected from Test Pit E86 at a depth of 4 feet bgs, while TPH was detected at concentrations above the UCLs in samples collected from GZA-304D at a depth of 8-10 feet bgs and 12-14 feet bgs, GZ-306S at a depth of 6-8 feet bgs and GZ-310 8-9 feet bgs. These UCL exceedances coincide with observations of petroleum and/or coal tar-like impacts at depths generally at or below the water table. As further discussed below, these samples where UCL exceedances were observed were also submitted for fingerprint analysis. Table P-2 (*Subsurface Soil Data*) in **Appendix P** presents the analytical subsurface soil data collected in this area.

Soil TPH Fingerprinting Results

Twenty (20) soil samples were submitted for TPH fingerprinting from explorations in the area. As noted above, these samples were also submitted for TPH analysis, with detections ranging from 175 – 631,000 mg/kg. The samples collected from RCA-1, Test Pit E86 4 feet bgs, GZ-304D, GZ-306S 6-8 feet bgs and GZ-310 were fingerprinted as “coal tar” or “tar impacted hydrocarbons”, the samples collected from E86 3.5 feet bgs and 4.5 feet bgs, the samples collected from RCA-2, Test Pit D87, GZ-302D, GZ-303D, GZ-307S, GZ-308S, GZ-309D and GZ-312D were fingerprinted as “lubricating oil”, “Fuel No. 6” or “majority middle distillate” and the samples collected from GZ-305S and GZ-306S 10-12 feet bgs were fingerprinted as “mix of middle distillate petroleum, heavy petroleum and tar impacted hydrocarbons”. A summary of the soil TPH fingerprinting results are presented on Table P-3 (*Soil TPH Fingerprinting Results*) in **Appendix P**.

Groundwater and NAPL Gauging Results

Fifteen (15) shallow monitoring wells (RCA-1, RCA-2, RCA-12, RCA-12R, VHB-1, VHB-3, VHB-5, GZ-302S, GZ-303S, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-312S and U-1) and seven (7) deeper monitoring wells (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D and GZ-312D) were installed in the area. Three (3) additional groundwater grab samples were collected from temporary monitoring wells installed in 2000. Five (5) monitoring wells (VHB-3, GZ-311D, GZ-312S, GZ-312D and U-1) were decommissioned in 2016 (as described below). Based on historical elevation data from these monitoring wells, groundwater is expected to be encountered approximately 2-11 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for the wells within the area is presented in Table P-4 (*Groundwater and NAPL Gauging*) in **Appendix P**. Figure 6B presents the Shallow Groundwater Contour Plan for the Site. Regional groundwater flow at the Site is expected to flow onto the Site towards the Providence River, however, the presence of utilities in the area influence groundwater flow along the perimeter.

Trace amounts of LNAPL have been historically detected in VHB-1, VHB-2 and VHB-3 between 2002 and 2011 but has not been detected since 2011. Between May 2016 and December 2022, LNAPL was detected in monitoring GZ-307S in thicknesses ranging from 0.01 and 1.00 feet. DNAPL has not been encountered in the area. A summary of LNAPL gauging results for VHB-1, VHB-2 and VHB-3 are presented as Table P-5 (*Historical LNAPL Thicknesses – VHB-1, VHB-2 and VHB-3*) in

¹⁰ The majority of samples were submitted from above the water table; however some samples were submitted for TPH analysis and fingerprinting from below the water table. These samples were submitted to delineate the nature of observed petroleum – like and coal tar-like impacts that were observed in the area.

Appendix P and a summary of LNAPL gauging results for GZ-307S is presented as Table P-6 (*LNAPL Gauging – GZ-307S*) in **Appendix P**.

Groundwater Results

Ninety-nine (99) groundwater samples were collected in the area between 1994 and 2022 and analyzed for VOCs, SVOCs, TPH and total cyanide. Vinyl chloride was the only compound detected in excess of the RIDEM GB Groundwater Objectives in samples collected from RCA-1, RCA-12R, GZ-301D and GZ-303S.¹¹ Table P-7 (*Groundwater Analytical Data*) in **Appendix P** presents the analytical groundwater data collected in this area.

Groundwater TPH Fingerprinting Results

Two (2) groundwater samples were submitted for TPH analysis (including fingerprinting) from RCA-1 and RCA-2. The sample collected from RCA-1 was fingerprinted as “petroleum” and the sample collected from RCA-2 was fingerprinted as “kerosene / fuel oil”. A summary of the groundwater TPH fingerprinting results are presented on Table P-8 (*Groundwater TPH Fingerprinting Results*) in **Appendix P**.

Conclusions

Spatially, observations of petroleum-like impacts were generally observed on the western property line, along Allens Avenue and adjacent to the Site entrance. A mixture of petroleum-like and coal tar-like impacts were noted in the northwestern corner and along the northern property line, adjacent to the Former Motiva property.¹² No impacts were noted in the one boring (GZ-301/RCA-12R) completed along the southwestern property line.

This area exhibits widespread exceedances of RIDEM Method 1 Criteria in both surface and subsurface soils, which is consistent with historical filling patterns at the Site. RIDEM GB Groundwater exceedances were generally limited to vinyl chloride, which is not a constituent of concern at the Site. Several areas along the northern and northwestern Site property boundary had impacts associated with the former use of the property as a MGP (coal tar-like or purifier box -like impacts), which is consistent with the historical filling pattern on Site and may also be complicated by conveyance system which is present in this portion of the Site¹³ (as further discussed below). However, evidence of petroleum-like impacts was also noted along the northern property boundary (adjacent to the Former Motiva property) as well as along the western property line (adjacent to Allens Avenue). As demonstrated by the shallow groundwater contours and the presence of vinyl chloride and other chlorinated compounds (compounds that would not be typically associated with MGP or petroleum -like impacts), groundwater flows on to the Site from the north, the south, and the west. Based on these observations, and the historical operations located on the adjacent Former Motiva property, these petroleum-like impacts are likely associated with off-Site impacts that are flowing onto the Site. It should also be noted that while fingerprinting results indicated the presence of UCL exceedances for TPH in soil collected at or below the water table at explorations in the northwestern corner and along the northern property line, measurable NAPL has not been detected in the area monitoring wells, with the exception of GZ-307S. At this well location, which is located downgradient of the Former Motiva property, evidence of

¹¹ Vinyl chloride is not expected to be a constituent of concern associated with the Site. The detection of Vinyl Chloride at the Site is expected to from off-Site impacts.

¹² As noted above in Section 2.0 and in prior historical reports prepared for the Site, the Former Motiva property abuts the Site to the north and to the west and shares a common 1,000-foot property line and is inferred to be hydraulically upgradient and cross-gradient of the Site. Based on our review of RIDEM files, Motiva has been identified in the database as a RIDEM State Listed Site (SR-28-1476), RCRA generator, a registered UST property and a LUST site. The Former Motiva property has served as a gasoline station, lubricating oil blending, asphalt facility and oil and gas distribution facility since at least 1907. Crude oil was also made into liquid or solid asphalt products on a portion of the property. Based on a review of RIDEM files, at least several historical petroleum product releases have occurred at the former Motiva property. Soil and groundwater on Site may be impacted by the Former Motiva property.

¹³ It should be noted that historically, this drainage conveyance system extended back into the Site towards the Former B.P. Clapp Building. The continuation line has been capped but may be acting as a preferential pathway.

petroleum-like impacts was observed and confirmed through fingerprint analysis (fingerprinted as “majority middle distillate petroleum”).

3.1.4.2 Drainage Rehabilitation Area

This area includes the northwestern corner of the Site where the presence of sheens/product was noted in a portion of the on-Site drainage system (catch basins and conveyance piping). RI Energy’s existing facility control building (offices) is located to the south of the drainage rehabilitation area. Historically, this area was part of the Narragansett Bay and was gradually filled during the 19th century. The majority of the drainage rehabilitation area is currently improved with asphalt pavement. The remainder of the western portion of the drainage rehabilitation area does not yet have an engineered cap and is currently vegetated with grass. It should be noted that historically, this drain line extended further east into the Site towards the former B.P. Clapp Building.

As described below, sheen / product was identified in both catch basin structures and the conveyance piping between them in 2012. Results of forensic testing indicated that the sheen was comprised of complex mixtures of variably weathered petroleum, with the major component being “middle distillate petroleum” (*i.e.*, diesel fuel, or fuel oil #2). The source of this sheen / product is unknown.

As part of the 2014 investigation, GZA completed six (6) additional soil borings (GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S and GZ-309D) in the drainage rehabilitation area to further characterize the soil and groundwater impacts in this portion of the Site. A total of twenty-three (23) explorations (E84, E85, E86, F43, F44, F45, F46, F47, F48, F56, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-309D, RCA-1, VHB SS-7, VHB SS-8, VHB-1, VHB-15, Test Pit E86 and Test Pit F56) were performed directly proximate to the drainage rehabilitation area, to depths ranging from 6 to 30 feet bgs. Eight monitoring wells are located in the area (RCA-1, VHB-1, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S and GZ-309D). These explorations are shown on the attached Figure Q-1 (*Exploration Location Plan*) in **Appendix Q (Data Gap – Drainage Rehabilitation Area)**. The limits of the drainage rehabilitation data gap area were generally defined as the area directly proximate to the drain line. Boring and test pit logs are included in **Appendix Q**.

The following sections provide a background of rehabilitation activities that were conducted in this area, a discussion of the extent of impacts in the area (field screening and observations of impacted soils, subsurface soil impacts, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein.

Summary of Rehabilitation Activities

As noted below, TNEC performed rehabilitation activities between May 2012 and January 2013. Rehabilitation activities consisted of thoroughly cleaning the drainage structures and vitrified clay conveyance piping, sealing the drainage structures and conveyance piping utilizing acrylamide grout, hydraulic cement and a spray-on epoxy system and final sealing utilizing a cured-in-place liner. Approximately 290 feet of piping was sealed utilizing a cured-in-place liner.

Visual observations/sampling of the drainage structures have been conducted on average monthly basis since February 2013. Visual observations/sampling consisted of sampling the water in the structure (if possible) for odors, sheens and turbidity. If the structure was dry, visual sampling from above was conducted for odors and significant sheens. Oil containment booms and snares have remained in the catch basins to contain any sheen or petroleum, on an as-needed basis. Between February 2013 and September 2022, containment booms and snares have remained in the catch basins to contain any sheen or petroleum. Although some sheening has been observed in CB-02, no sheening has been observed in downgradient structures (MH-01). Additionally, as part of the existing NBC sewer connection permit for the Natural Gas Regulation Facility building, annual wet weather sampling has been conducted in MH-01 from 2013 to 2021. No evidence of sheen or product has been observed.

Field Screening and Observations of Impacted Soils

A review of boring and test pit logs from the area indicates the presence of approximately 12 to 16 feet of fill underlain by organic silts, outwash deposits and glacial till (unknown thickness to bedrock). In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. Visual indicators of petroleum-like saturation were noted on the boring logs for E86 (2-6 feet bgs), F44 (6-10 feet bgs), Test Pit E86 (2-6 feet bgs), VHB-1 (4-14 feet bgs), GZ-307S (4-16 feet bgs), GZ-308S (4-6 feet bgs) and GZ-309D (10-14 feet bgs). Petroleum odors were noted in most borings located in the drainage rehabilitation area (E84, E85, E86, F44, F45, F46, F47, F48, F56, F57, Test Pit E86, VHB-1, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S and GZ-309D). Petroleum odors were generally noted coincident with the water table (depths of approximately 6 to 14 feet bgs). Visual and olfactory evidence of coal tar-like impacts (sometimes noted as “asphaltic”) were noted in RCA-1 (6-16 feet bgs), VHB-15 (9-14 feet bgs), GZ-304D (9-16 feet bgs), GZ-306S (6-8 feet bgs) and GZ-309D (8-16 feet bgs). TVOCs readings from these borings ranged from ND to approximately 717 ppmv. Generally, TVOC readings increased with depth until approximately 2 feet below the water table and decreased thereafter. As indicated previously a mixture of petroleum-like and coal tar-like impacts were noted within the drainage rehabilitation area, which is located in the northwestern corner and along the northern property line, adjacent to the Former Motiva property.

Subsurface Soils

Subsurface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and inorganic compounds. A total of thirty-one (31) samples were submitted for analysis.¹⁴ The compounds that were detected in excess of the RIDEM I/C-DEC were benzene (0.008 – 326 mg/kg), TPH (48.6 – 631,000 mg/kg), arsenic (4.2 – 81.9 mg/kg), lead (5.9 – 1,610 mg/kg), Benzo [a] anthracene (0.454 – 2,080 mg/kg), Benzo [a] pyrene (0.269 – 923 mg/kg), Benzo [b] fluoranthene (1.08 – 894 mg/kg), Benzo [k] fluoranthene (1 – 740 mg/kg), Chrysene (0.624 – 2,060 mg/kg), Dibenzo [a,h] Anthracene (0.211 – 205 mg/kg), Indeno [1,2,3-cd] Pyrene (0.586 – 382mg/kg) and Naphthalene (0.76 – 165,000 mg/kg). The compounds that were detected in excess of the RIDEM GB Leachability Criteria were benzene (0.008 – 326 mg/kg), toluene (0.0401 – 417 mg/kg) and TPH (48.6 – 631,000 mg/kg). Naphthalene was detected in excess of the RIDEM UCL in the sample collected from Test Pit E86 at a depth of 4 feet bgs. TPH was detected above the RIDEM UCL in samples from GZA-304D at a depth of 8-10 feet bgs and 12-14 feet bgs and GZ-306S at a depth of 6-8 feet bgs. As indicated below, these UCLs appear to be associated with observations of petroleum-like and coal tar-like impacts and were confirmed via fingerprint analysis. Table Q-1 (*Subsurface Soil Data*) in **Appendix Q** presents the analytical subsurface soil data collected in this area.

Soil TPH Fingerprinting Results

Thirteen (13) soil samples were submitted for TPH fingerprinting, including total TPH analysis, from explorations in the area. The samples collected from RCA-1, Test Pit E86 4 feet bgs, GZ-304D and GZ-306S 6-8 feet bgs were fingerprinted as “coal tar” or “tar impacted hydrocarbons”, the samples collected from E86 3.5 feet bgs and 4.5 feet bgs, GZ-307S, GZ-308S and GZ-309D were fingerprinted as “lubricating oil”, “Fuel No. 6” or “majority middle distillate” and the samples collected from GZ-305S and GZ-306S 10-12 feet bgs were fingerprinted as “mix of middle distillate petroleum, heavy petroleum and tar impacted hydrocarbons”. A summary of the soil TPH fingerprinting results are presented on Table Q-2 (*Soil TPH Fingerprinting Results*) in **Appendix Q**.

Groundwater and NAPL Gauging Results

There are eight (8) active monitoring wells present directly within the area (RCA-1, VHB-1, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S and GZ-309D). Based on historical elevation data from these monitoring wells, groundwater is expected to be encountered approximately 2-5 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for

¹⁴ The majority of samples were submitted from above the water table; however some samples were submitted for TPH analysis and fingerprinting from below the water table. These samples were submitted to delineate the nature of observed petroleum – like and coal tar-like impacts that were observed in the area.

the wells within the area is presented in Table Q-3 (*Groundwater and NAPL Gauging*) in **Appendix Q**. Figure 6B presents the Shallow Groundwater Contour Plan for the Site. Groundwater flow in this area appears to be influenced by the utilities in this area, with groundwater flowing into the area of the Site from the north and west.

Trace amounts of LNAPL was detected in VHB-1 between 2002 and 2005, but LNAPL was not detected between 2005 and 2016. Between May 2016 and December 2016, LNAPL was detected in monitoring GZ-307S in thicknesses ranging from 0.04 and 0.33 feet. DNAPL has not been encountered in the area. A summary of LNAPL gauging results for VHB-1 is presented as Table Q-4 (*Historical LNAPL Thicknesses*) in **Appendix Q** and a summary of LNAPL gauging results for GZ-307S is presented as Table Q-5 (*Historical LNAPL Gauging*) in **Appendix Q**.

Groundwater Results

Fifty-five (55) groundwater samples were collected from nine monitoring wells in the drainage rehabilitation area between 1994 and 2022 and analyzed for VOCs, SVOCs, TPH and total cyanide. Vinyl chloride the only compound detected in excess of the RIDEM GB Groundwater Objectives in a sample collected from RCA-1.¹⁵ Table Q-6 (*Groundwater Analytical Data*) in **Appendix Q** presents the analytical groundwater data collected in this area.

Groundwater TPH Fingerprinting Results

A groundwater sample collected from RCA-1 was submitted for TPH analysis including fingerprinting in 1996. TPH was detected at 1 mg/L. The sample collected was fingerprinted as “petroleum.” A summary of the groundwater TPH fingerprinting results are presented on Table Q-7 (*Groundwater TPH Fingerprinting Results*) in **Appendix Q**.

Sheen/Product TPH Fingerprinting Results

GZA collected several samples of sheen/product from drainage structures (MH-01, CB-01 and CB-02) located in the area, which were submitted to New Fields Analytical Laboratory of Rockland, Massachusetts for fingerprint analysis. Results identified the sheen/product samples as “middle distillate petroleum.” A summary of the sheen/product TPH fingerprinting results are presented on Table Q-8 (*Sheen/Product TPH Fingerprinting Results*) in **Appendix Q**.

Conclusions

Prior to rehabilitation activities, the drainage structures and associated conveyance piping in the northwestern portion of the Site have likely been acting as a preferential pathway for product in this area. All sheen/product samples collected within the drainage structures (prior to rehabilitation) were fingerprinted to be “middle distillate petroleum”, while most of the soil and groundwater impacts in this area generally consisted of a mix of impacts associated with petroleum and coal tar -like impacts. Additionally, since the drainage rehabilitation activities were conducted, LNAPL has been observed in monitoring well GZ-307S, which is located approximately 40 feet north of the repaired drainage line, immediately along the northern property line with the Former Motiva property, possibly because the drainage line and structures has been sealed. The shallow groundwater contours and the presence of vinyl chloride and other chlorinated compounds (compounds that would not be typically associated with MGP or petroleum – like impacts) indicate that groundwater flows on to the Site from the north and the west. Based on the soil and groundwater data presented above, the petroleum-like impacts observed in the drainage structures in this area appears to be migrating from an off-Site source to the north and/or west.

¹⁵ Vinyl chloride is not expected to be a constituent of concern associated with the Site. The detection of Vinyl Chloride at the Site is expected to from off-Site impacts.

3.1.4.3 NATURAL GAS LEAK REPAIR AREA

As described below, sheen was observed in the excavation associated with the natural gas piping repair proximate to the Former Booster House. This pipeline extends from the interior portions of the 642 Allens Avenue property to Allens Avenue. Results of forensic testing identified the sheen to be comprised of primarily “heavy middle distillate” (e.g., cutting oil, light lubricating oil, or gear oil), with low levels of pyrogenic PAHs, which may be indicative of coal tar residue or historical industrial processes. As part of the 2014 investigation, GZA further evaluated data in the vicinity of the natural gas repair. It is noted that additional explorations were not able to be conducted in the direct vicinity of this area due to the presence of extensive utilities¹⁶. The following sections provide a background of the natural gas leak repair area, a discussion of the extent of impacts in the area (field screening and observations of impacted soils, subsurface soil impacts, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein. Soil data was only evaluated in the direct vicinity (horizontally and vertically) of the natural gas leak repair area, while groundwater data (proximate to the natural water table only) was only evaluated along the “utility corridor” surrounding the natural gas leak repair area (not located directly proximate to the work area). Figure R-1 (*Exploration Location Plan*) in **Appendix R (Data Gap – Natural Gas Leak Repair Area)** presents the areas evaluated along with this data gap.

Six (6) explorations (E59, E73, F35, F52, F53 and Test Pit F35) were performed within 20 feet of the natural gas leak repair area, to depths ranging from 6 to 10 feet bgs. These explorations are shown on the attached Figure R-1 in **Appendix R**. Four (4) monitoring wells were located along the “utility corridor” (as described above) (VHB-2, GZ-302S, GZ-303S and GZ-401). Four (4) additional groundwater grab samples were collected from temporary monitoring wells installed in 2000. One (1) monitoring well (GZ-401) was decommissioned in 2016 (as described below) Monitoring well VHB-2 was noted as destroyed in 2008. Boring and test pit logs are included in **Appendix R**.

Field Screening and Observations of Impacted Soils

All the explorations completed in this area have been relatively shallow. Review of these logs indicates the presence of at least approximately 10 feet of fill. Other deeper borings proximate to the area consist of 15 to 20 feet of fill underlain by some intermittent organic peats, outwash deposits and glacial till. In general, the fill consists of sands and gravels with concrete and wood fragments, cinders, cinder ash, coke and coal fragments. Visually and olfactory indicators of petroleum like impacts were not noted in any of the shallow explorations conducted in this area. TVOCs readings from these explorations were generally ND.

Subsurface Soils

Subsurface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, and inorganic compounds. A total of five (5) samples were submitted for analysis. The compounds that were detected in excess of the RIDEM I/C-DEC were TPH (230 – 19,000 mg/kg), Benzo [a] anthracene (2.3 to 100 mg/kg), Benzo [a] pyrene (1.3 – 72 mg/kg), Benzo [b] fluoranthene (3.5 – 100 mg/kg), Dibenzo [a,h] Anthracene (0.42 – 12 mg/kg) and Indeno [1,2,3-cd] Pyrene (1.4 – 35 mg/kg). Exceedances of the RIDEM GB Leachability were limited to TPH, detected above the RIDEM I/C-DEC and GB Leachability Criteria in one (1/5) sample only, F52 collected between 2-4 feet bgs at a concentration of 19,000 mg/kg. Visual and olfactory indicators of impacts were not noted in this boring. RIDEM UCLs were not exceeded. Table R-1 (*Subsurface Soil Data*) in **Appendix R** presents the analytical subsurface soil data collected in this area.

¹⁶ Utilities noted in this area of the Site include at least active and inactive gas lines, active and inactive water lines, and active drain lines. Utility corridors and inactive utilities that have not been grouted when abandoned, may fill with groundwater and may present a preferential pathway for both groundwater and impacts. Other unknown utilities are likely present in the area.

Groundwater and NAPL Gauging Results

There were four (4) monitoring wells present near the “utility corridor” (as noted above VHB-2 was noted as destroyed in 2008). Based on historical elevation data from these monitoring wells, groundwater is expected to be encountered approximately 4 to 8 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for the wells within the area is presented in Table R-2 (*Groundwater and NAPL Gauging*) in **Appendix R**. NAPL has not been detected in any of these wells.

Groundwater Results

Nine (9) groundwater samples were collected from seven (7) monitoring wells along this “utility corridor” between 2000 and 2014 and analyzed for VOCs, SVOCs, TPH and total cyanide. SVOCs or TPH have not been detected in the groundwater samples collected in this area. Table R-3 (*Groundwater Analytical Results*) in **Appendix R** presents the analytical groundwater data collected in this area. Vinyl chloride the only compound detected in excess of the RIDEM GB Groundwater Objectives in a sample collected from GZ-303S.¹⁷ Compounds associated with MGP, or petroleum-like impacts (benzene, ethylbenzene, toluene, xylenes or naphthalene for example) were not detected in concentrations approaching the GB Groundwater Objectives in any of these samples.

Sheen TPH Fingerprinting Results

GZA collected a sample of sheen observed from the natural gas leak repair excavation, which was submitted to New Fields Analytical Laboratory of Rockland, Massachusetts for fingerprint analysis. Results of testing identified the sheen to be comprised of primarily “heavy middle distillate” (e.g., cutting oil, light lubricating oil, or gear oil), with low levels of pyrogenic PAHs, which may be indicative of coal tar residue. A summary of the sheen TPH fingerprinting results are presented on Table R-4 (*TPH Fingerprinting Results*) in **Appendix R**.

Conclusions

Based on the soil and groundwater data presented above, the sheen observed during the natural gas repair work is likely associated with the “utility corridor” in this area. The “utility corridor” is likely acting as a preferential pathway for the observed sheens in this area. NAPL or groundwater impacts were not noted in any of the monitoring wells present along this utility corridor (both upgradient and downgradient). In conclusion, although sheens have been noted in this area, these impacts do not appear to be migrating off Site.

As described in below, a portion of this area was capped with new asphalt paving as part of remedial actions associated with the Holder 18/21 Capping Project. These activities were documented in the April 2017 *Short Term Response Action Completion Report – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC. This report was submitted to RIDEM on April 28, 2017.

3.1.4.4 LEAD UCLS IN THE FORMER GASHOLDER AREA

Four (4) surface soil samples collected directly proximate to Former Gasholders Nos. 18 and 21 exceeded the total lead UCL of 10,000 mg/kg. The location of the two Gasholders is shown on Figure S-1. The two Gasholders were decommissioned and demolished in 2010 as documented in the July 2010 *Construction Completion Report for Decommissioning and Demolition of Gasholders #18 and #21, Allens Avenue, Former MGP, Providence, Rhode Island* prepared by Brown and Caldwell on behalf of TNEC. The extent of the soil disturbance associated with this decommissioning work is unknown. Additional investigations were completed by GZA in 2014 to further delineate the nature and extent of lead impacts in this area following demolition of the

¹⁷ Vinyl chloride is not expected to be a constituent of concern associated with the Site. The detection of Vinyl Chloride at the Site is expected to be attributed to an off-Site/upgradient source.

Gasholders. The following sections provide a discussion of the extent of lead impacts in surface soils in this the area and our conclusions based on the information presented herein. The limits of this data gap area were generally defined as directly proximate to the Former Gasholders.

Between 1994 and 2000, eight-two (82) surface soil samples were collected proximate to the Former Gasholders and submitted for total lead analysis (SU-1 No.1 (0-3"), SU-1 No.1D (12-15"), SU-1 No.2 (0-3"), SU-1 No.3 (0-3"), SU-1 No.3D (12-15"), SU-1 No.4 (0-3"), SU-1 No.4D (12-15"), SU-1 No.5 (0-3"), SU-1 No.6 (0-3"), SU-1 No.7 (0-3"), SU-1 Composite (0-3"), SU-2 No.1 (0-3"), SU-2 No.1D (12-15"), SU-2 No.3 (0-3"), SU-2 No.4 (0-3"), SU-2 No.4D (12-15"), SU-2 No.5 (0-3"), SU-2 No.6 (0-3"), SU-2 No.6D (12-15"), SU-2 No.7 (0-3"), SU-2 Composite (0-3"), Unit #2 SU-2-A1 (0-3"), Unit #2 Replicate SU-1 No.6 (0-3"), Unit #2 Replicate SU-1 No.2 (0-3"), Unit #2 SU-2-A4 (0-3"), Unit #2 SU-2-B1 (0-3"), Unit #2 SU-2-B4 (0-3"), Unit #2 SU-2-C1 (0-3"), Unit #2 SU-2-C4 (0-3"), Unit #2 SU-2-D1 (0-3"), Unit #2 SU-2-D2 (0-3"), Unit #2 SU-2-D3 (0-3"), Unit #2 SU-2-D4 (0-3"), Unit #2 SU-2-E1 (0-3"), Unit #2 SU-2-E2 (0-3"), Unit #2 SU-2-E3 (0-3"), Unit #2 SU-2-E4 (0-3"), Unit #2 Replicate SU-2 No.1 (0-3"), Unit #2 Replicate SU-2 No.6 (0-3"), Unit #2 Replicate SU-2 No.3 (0-3"), Unit #2 SU-2-G4 (0-3"), Unit #2 SU-2-H1 (0-3"), Unit #2 SU-2-H2 (0-3"), Unit #2 SU-2-H3 (0-3"), Unit #2 SU-2-H4 (0-3"), E01 0-2 FT, E02 0-2 FT, E09 0-2 FT, E20 0-2 FT, E21 0-2 FT, E22 0-2 FT, E23 0-2 FT, E24 0-2 FT, E25 0-2 FT, E26 0-2 FT, E27 0-2 FT, E28 0-2 FT, E29 0-2 FT, E30 0-2 FT, E31 0-2 FT, E32 0-2 FT, E34 0-2 FT, E35 0-2 FT, E36 0-2 FT, E41 0-2 FT, E42 0-2 FT, E43 0-2 FT, E53 0-2 FT, E58 0-2 FT, E93 0-2 FT, E94 0-2 FT, E95 0-2 FT, E96 0-2 FT, E97 0-2 FT, E98 0-2 FT, F01 0-2 FT, F02 0-2 FT, F03 0-2 FT, F04 0-2 FT, F05 0-2 FT, F06 0-2 FT, and F58 0-2 FT). A total of ten (10) additional surface soil samples (SS-301 0-1 FT, SS-302 0-1 FT, SS-303 0-1 FT, SS-304 0-1 FT, SS-305 0-1 FT, SS-306 0-1 FT, SS-307 0-1 FT, SS-308 0-1 FT, SS-309 0-1 FT, and SS-310 0-1 FT) were collected by GZA between 2014 and 2015 proximate to the Former Gasholders to assess post-demolition surface soil conditions. These explorations are shown on the attached Figure S-1 (*Exploration Location Plan*) in **Appendix S (Data Gap – Lead UCLs in the Former Gasholder Area)**.

Surface Soils Analytical Results (Total Lead, TCLP Lead and SPLP Lead)

Total lead was detected in ninety (90/92) samples at concentrations ranging from 14.1 to 21,100 mg/kg, with fifty-nine (59/92) samples detected in excess of the RIDEM I/C-DEC of 500 mg/kg and four (4/92) samples detected in excess of the RIDEM UCL of 10,000 mg/kg. None of the samples collected by GZA in 2014-2015 exceeded the RIDEM UCL. TCLP lead was detected in eight (8/10) samples at concentrations ranging from 3.35 to 36 mg/L. Five (5) samples with TCLP results in excess of 5 mg/L were re-analyzed in July 2015 for SPLP Lead analysis.¹⁸ SPLP lead was detected in these samples (5/5) at concentrations ranging from 0.232 to 2.93 mg/L. Table S-1 (*Surface Soil Data*) in **Appendix S** presents the surface soil data (total lead, TCLP lead and SPLP lead) collected in this area.

Groundwater Analytical Results (Total Lead)

No groundwater samples in the area were submitted for lead analysis, however, samples of containerized groundwater were collected from the area during the gas line repair dewatering effort completed in 2013¹⁹. One grab sample was collected during dewatering and exceeded the RIDEM GA Groundwater Objective for lead (0.015 mg/L); this sample was collected during active dewatering and was likely very turbid (which leads to increased metal concentrations associated with suspended soil particles). Two influent grab samples were collected from the discharge of the tanks prior to treatment via the on-Site treatment system. Both influent samples were very low (far below the RIDEM GA Groundwater Objectives) to ND for lead and are likely more representative of actual groundwater conditions in the area. This data further reinforces that the lead and the low SPLP lead concentrations detected proximate to the Former Gasholder are likely not impacting

¹⁸ SPLP analysis is a SW-846 test method that can be used with soil samples to estimate the site-specific adsorption-desorption potential of a compound that may impact groundwater. The analysis is intended to simulate the effect of rainfall (which eventually makes it to the groundwater) on compounds that are sorbed to soil particles.

¹⁹ Summary Letter Report – Temporary On-site Treated Groundwater Discharge Permit prepared by GZA on behalf of TNEC submitted to RIDEM on May 23, 2013.

groundwater at the Site. Table S-2 (*Groundwater Samples (lead only)*) in **Appendix S** presents the groundwater data (total lead) collected during the dewatering activities completed in this area.

Conclusions

Based on the soil (including the more recent and likely more representative soil samples collected by GZA in 2014) and groundwater data presented above, an engineered cap was implemented in this area during recent remedial activities to prevent exposure to impacted surface soils (including lead concentrations). As described below, the engineered caps within the Former Gasholder area consisted of new asphalt paving or a topsoil engineered cap. Surface soils in the vicinity of the Former Gasholders was segregated during clearing and grubbing activities and recycled at ESMI in Loudon, NH. As described above, these remedial activities were documented in the April 2017 *Short-Term Response Action Completion Report – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC, submitted to RIDEM on April 28, 2017.

3.1.4.5 COVE AREA

Sheen observations have been consistently observed at mid and low tide since at least 1996. The cove is directly proximate to an area referred to as the "seep area". In 1996, several remedial actions were completed in the area to address the source of the sheens, as documented in the 1996 *Phase II Field Characterization Investigation* prepared by RCA and in 2002 as documented in November 2002 *Remedial Action Closure Report* prepared by VHB. These remedial actions included the completion of significant excavation along the shoreline to address former historical structures and potential sources to the observed sheens. The limits of this data gap area were generally defined as within 100 feet of the edge of the Providence River.

The following sections provide a discussion of the historical activities in this area, the extent of impacts in the area (field screening and observations of impacted soils, subsurface soil impacts, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein. Sixty (60) explorations (RCA-3, RCA-4, RCA-5, RSS-1, RSS-2, RSS-3, RSS-4, RSS-5, RSS-6, RSS-7, RCA-R10, B07, B08, B09, B17, B18, B20, B21, B22, B23, B24, B25, B26, D94, Test Pit B07, Test Pit B09, RHB-2, RHB-3, RHB-4, RHB-6, VHB-4, TP-1, TP-2, TP-6, TP-35, TP-36, TP-37, CHES RW-3, CHES RW-4, GZ-313D, GZ-314S/D, GZ-315S/D, B-62, B-63, B-70, B-70A, B-71, B-72, B-73A, B-74, B-75, B-76, B-77, B-78, B-79, GZ-7A-7E, SB-06, Golder B-202, Golder B-203 and Golder B-204) were performed directly proximate to the cove area, to depths ranging from 2 to 174 feet bgs. Eight (8) monitoring wells (RCA-3, RCA-4, RCA-5, VHB-4, GZ-313D, GZ-314S, GZ-314D and GZ-315D) and two (2) recovery wells (CHES RW-3 and CHES RW-4) were located in this area. One (1) additional groundwater grab sample was collected from a temporary monitoring well (B22) installed in 2000. Monitoring wells RCA-4 and VHB-4 were noted as destroyed in 2002. The remainder of the wells (RCA-3, RCA-4, RCA-5, VHB-4, GZ-313D, GZ-314S, GZ-314D, GZ-315D, CHES RW-3 and CHES RW-4) were decommissioned in 2016 (as described below). These explorations are shown on the attached Figure T-1 (*Exploration Location Plan*) in **Appendix T (Data Gap – Cove Area)**. Boring and test pit logs are included in **Appendix T**.

Please note that sampling depths that are noted in the following discussion are from the 2014 grades in the area. As noted above, portions of the area have been remediated and capped and relative sampling depths are unknown. The discussion of environmental impacts presented in the following paragraphs pertains to material remaining within the area limits following the remedial activities discussed previously based on GZA's review of available information.

Historical Use Proximate to the Cove

This area of the Site was occupied by MGP operations from at least 1910 to 1954. At least fourteen (14) historical structures were located directly proximate to the cove, in the immediate upland portions of the Site: Former Salt Water Intake, two Former Filters, a Former Relief Gasholder No. 16, Former Open Cooling Tank, Former Open Separating Tank, Former Open Tar Tank, Former Salt Water Condenser, Former Engine/Power House, Former Boiler House, Former Exhauster House, Former Storage/Battery Room, Former Water Gas Generator House and Former Coal Bin. The approximate locations of these historical features are presented on Figure 5B. The area was used to manufacture gas, purify gas and store manufactured gas prior to distribution. During operations, the area was mostly used for CWG production. The former

saltwater intake structure was used to intake cooling water to be used for gas manufacture and distribution. After the process of gasification, subsequent processes involved removing tars, water, oils, and other constituents to improve the quality of the gas. The primary by-products of the CWG process were coal tar, ash and clinker.

The Former Gasholder that was located within the cove area was an above grade Gasholder. Based on information presented in the December 1998 *RAWP* prepared by ESS on behalf of PGC, the holder structure itself was entirely above grade and was supported by a timber pile relieving platform. The relieving platform was likely designed to mitigate settlement of the underlying compressible soils due to the placement of the approximately nine feet of backfill required to meet design elevations. Seven borings were performed within the footprint of the Former holder (RHB-1, RHB-2, RHB-3, RHB-4, RHB-5, RHB-6 and RCA-B11). These borings indicated approximately one foot of concrete at the surface underlain by approximately 9 feet of petroleum-like impacted sands and gravels, consistent with the foundation system described above. At approximately nine to ten feet bgs, all borings encountered refusal, likely on the underlying pile cap section. The December 1998 *RAWP* proposed to maintain the existing concrete cap/pad as an encapsulation for the petroleum-like impacted sands and gravels within.

From June 1 to July 17, 2015, Weidlinger Associates Inc. on behalf of Kiewit Power Constructors (Kiewit) performed geotechnical investigation within the footprint of the liquefaction facility for the pre-design of the foundations for the liquefaction buildings and equipment. This investigation included test borings to depths ranging from 51 feet to 101 feet below grade, boring logs from this investigation are included in **Appendix T**. Hydrocarbon like odors and sheens were noted boreholes B-203 and B-204, which are proximate to the Former Relief Gas Holder #16 and former filter, respectively. Weidlinger did not collect soil samples for environmental testing as part of their investigation. At the beginning of the liquefaction project in February 2019, Kiewit performed a test pit excavation to evaluate the timber piles supporting Former Relief Gas Holder #16. During this excavation NAPL was encountered, NAPL and groundwater were removed from the excavation during the test pitting activities. This dewatering water and NAPL were disposed of as part of the Liquefaction project, disposal documentation is included in the STRAP Closure Report dated March 21, 2023.

Field Screening and Observations of Impacted Soils

A review of boring and test pit logs from the area indicates the presence of approximately 15 to 20 feet of fill underlain by organic silts (variable thickness of at least 12 to up to 83 feet), outwash deposits (also known herein as bearing sand; at least 60 feet in thickness) and glacial till (unknown thickness to bedrock). In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. Visual indicators of petroleum-like saturation were noted on the boring logs for B-70 (10-15 feet bgs), B-70A (0-15 feet bgs), B-72 (5-10 feet bgs), B-74 (5-15 feet bgs), RCA-4 (4-10, 12-14, and 24-26 feet bgs), RCA-5 (10-12 and 14-16 feet bgs), B07 (2-6 feet bgs), B20 (4.5-6 feet bgs), B24 (9.75-10 feet bgs), GZ-314S/D (2-6 and 12-19 feet bgs), GZ-315D (2-18 feet bgs) and B-203 (14-20 feet bgs). Petroleum-like odors were noted in most borings located in the cove area (B-70, B-70A, B-71, B-72, B-74, GZ-7C, RCA-4, B07, B09, B17, B20, B21, B22, B24, B25, B49, Test Pit B07, Test Pit B09, GZ-313D, GZ-314S/D, GZ-315D, SB-06, B-202, B-203 and B-204) and were generally noted coincident with the water table (depths of approximately 6 to 14 feet bgs). Visual and olfactory evidence of coal tar-like impacts were noted in RCA-3 (10-12 feet bgs) and VHB-4 (6-14 feet bgs). These two explorations are located adjacent to the oil water separator which is connected to the storm drain system for portions of the Site where historical MGP operations were located. took place. Several deeper borings/monitoring wells were completed in this area (GZ-313D, GZ-314S/D, GZ-315S/D, B-62, B-63, B-70, B-70A, B-71, B-72, B-73A, B-74, B-75, B-76, B-77, B-78, B-79, GZ-7A-7E, SB-06, Golder B-202, Golder B-203 and Golder B-204) to delineate the vertical extent of impacts. Petroleum-like or coal tar-like impacts were limited to the fill and the upper 1 to 2 feet of the organic silts in this area. TVOCs readings from these borings ranged from ND to approximately 1,700 ppmv. Generally, TVOC readings increased with depth until approximately 2 feet below the water table and decreased thereafter.

Boring located within the Former Gasholder foundation (RHB-2, RHB-3, RHB-4 and RHB-6) generally indicated petroleum-like odors increasing with depth to the bottom of the relieving platform.

Field Screening and Observations of Sediments

Several borings/explorations were conducted in the sediments downgradient of the cove (B-76, B-77, B-78, B-79, RSS-1, RSS-2, RSS-3, RSS-4, RSS-5, RSS-6 and RSS-7). The B-series (geotechnical boring) were completed approximately 30 feet from the shoreline and the RSS-series (sediment sample) were completed approximately 5 feet from the shoreline. Visual or olfactory evidence of impacts were not noted in the B-series which were installed to depths of approximately 52 to 62 feet below mudline, while visual and olfactory indicators of petroleum-like and/or coal tar-like impacts were observed in all of the RSS-series explorations at depths of approximately feet 1.5 feet below mudline.

Subsurface Soils

Subsurface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and/or inorganic compounds. A total of forty-six (46) samples were submitted for analysis.²⁰ The compounds that were detected in excess of the RIDEM I/C-DEC were TPH (110 – 11,100 mg/kg), TPH diesel range organics (DRO) (10,000 – 11,000 mg/kg), arsenic (2 – 15 mg/kg), lead (6.6 – 895 mg/kg), Benzo [a] anthracene (0.288 to 32.2 mg/kg), Benzo [a] pyrene (0.42 – 96 mg/kg), Benzo [b] fluoranthene (0.32 – 57.6 mg/kg), Dibenzo [a,h] Anthracene (0.087 – 7.8 mg/kg) and Indeno [1,2,3-cd] Pyrene (0.23 – 27 mg/kg). The compounds that were detected in excess of the RIDEM GB Leachability Criteria were TPH (110 – 11,100 mg/kg) and TPH DRO (10,000 – 11,000 mg/kg). RIDEM UCLs were not exceeded in the soil samples analyzed in this area of the Site. Soil exceedances of the RIDEM I/C-DEC and the GB Leachability Criteria were generally widespread throughout the cove area. Table T-1 (*Subsurface Soil Data*) in **Appendix T** presents the analytical subsurface soil data collected in this area.

Soil TPH Fingerprinting Results

Five (5) soil samples were submitted for TPH fingerprinting from RCA-3 (8-10 feet bgs), RCA-4 (8-10 feet bgs), RCA-5 (14-16 feet bgs), ETP-38 (8.5 feet bgs) and GZ-313D (18-20 feet bgs). The samples collected from RCA-3 and RCA-5 were fingerprinted as “fuel oil”, the samples collected from RCA-4 and ETP-38 were fingerprinted as “fuel oil mixed with coal tar” and the sample collected from GZ-313D was fingerprinted as “tar impacted hydrocarbons”. A summary of the TPH soil fingerprinting results is presented in Table T-2 (*Soil TPH Fingerprinting Results*) in **Appendix T**.

Sediment TPH Fingerprinting Results

Seven (7) sediment samples were submitted for TPH fingerprinting from RSS-1, RSS-2, RSS-3, RSS-4, RSS-5, RSS-6 and RSS-7. The samples collected from RSS-1, RSS-2, RSS-3, RSS-4 and RSS-7 were fingerprinted as “coal tar / fuel oil”, the sample collected from RSS-5 was fingerprinted as “fuel oil” and the sample collected from RSS-6 was fingerprinted as “diesel / coal tar”. A summary of the TPH sediment fingerprinting results is presented in Table T-3 (*Sediment TPH Fingerprinting Results*) in **Appendix T**.

Groundwater and NAPL Gauging Results

Eight (8) monitoring wells (RCA-3, RCA-4, RCA-5, VHB-4, GZ-313D, GZ-314S, GZ-314D and GZ-315D) and two (2) recovery wells (CHES RW-3 and CHES RW-4) were located in this area. One (1) additional groundwater grab sample was collected from a temporary monitoring well (B22) installed in 2000. Monitoring wells RCA-4 and VHB-4 were noted as destroyed in 2002. The remainder of the wells (RCA-3, RCA-4, RCA-5, VHB-4, GZ-313D, GZ-314S, GZ-314D, GZ-315D, CHES RW-3 and CHES RW-4) were decommissioned in 2016 (as described below). Based on elevation data from these monitoring wells, groundwater is expected to be encountered approximately 6 to 14 feet bgs in the cove area. A summary of historical

²⁰ The majority of samples were submitted from above the water table; however some samples were submitted for TPH analysis and fingerprinting from below the water table. These samples were submitted to delineate the nature of observed petroleum – like and coal tar-like impacts that were observed in the area.

groundwater elevation data for monitoring wells proximate to the cove is presented in Table T-4 (*Groundwater and NAPL Gauging*) in **Appendix T**. Groundwater is tidally influenced (0.5 to 3.5 fluctuations have been observed).

LNAPL has been historically detected proximate to the cove at thicknesses ranging from trace amounts to 2 feet, in wells RCA-4, RCA-5, CHES RW-3 and CHES RW-4. DNAPL has been detected in trace amounts in RCA-3. Table T-5 (*LNAPL Thickness Gauging*) and Table T-6 (*DNAPL Thickness Gauging*) in **Appendix T** present the historical LNAPL and DNAPL thicknesses, respectively. LNAPL has not been detected in thicknesses of more than 0.1 feet since 2006, has not been detected in thicknesses of more than 0.03 feet since 2011 and has only been detected in trace amounts since 2014.

Groundwater Results

Thirty (30) groundwater samples were collected from eight (8) wells proximate to the cove (RCA-3, RCA-4, RCA-5, GZ-313D, GZ-314S, GZ-314D, GZ-315D and temporary well point B22) between 1994 and 2016 and analyzed for VOCs, SVOCs, TPH and/or total cyanide. Naphthalene, benzene, ethylbenzene and/or toluene have been detected in excess of the RIDEM GB Groundwater Objectives in samples collected from RCA-4, MW-314S, MW-314D and MW-315D. Benzene has been detected in excess of the RIDEM GB Upper Concentration Limit (UCL) in samples collected in 1994 and 1996 from RCA-4. As indicated above, this well was destroyed in 2002 during remedial response actions. Groundwater samples collected from replacement wells (i.e., GZ-314S/D) installed proximate to this former well location do not indicate benzene concentrations above the UCL. Groundwater analytical data for monitoring wells proximate to the cove is presented as Table T-7 (*Groundwater Analytical Data*) in **Appendix T**.

Groundwater TPH Fingerprinting Results

Groundwater samples were submitted for TPH analysis (including fingerprinting) from RCA-3, RCA-4 and RCA-5 in 1994 and 1996. TPH ranged from 11.9 to 90 mg/L, with the highest concentrations observed in RCA-4. Samples collected from RCA-3, RCA-4 and RCA-5 in 1994 were all fingerprinted as “fuel oil”. Samples collected from RCA-3 and RCA-4 in 1996 were fingerprinted as “kerosene / fuel oil”. The sample collected from RCA-5 in 1996 was fingerprinted as “coal tar / fuel oil”. A summary of the TPH groundwater fingerprinting results is presented on Table T-8 (*Groundwater TPH Fingerprinting Results*) in **Appendix T**.

Sheen Observations

Between September 2011 and December 2016, the shoreline adjacent to the Site was inspected for the presence of sheens in the Providence River on at least a monthly basis. Portions of the Site’s shoreline are surrounded by both hard boom and absorbent sausage boom to contain any observed sheen. As described above, this boom has been in place since at least 2002. The current boom configuration is illustrated on Figure 3B. Sheens have been regularly observed proximate to the shoreline in the cove area. More significant sheens have generally been observed at mid- or low-tide only and generally consisted of bright spots and bands. Sheens observed at high tide were generally less significant and observed intermittently. A table summarizing sheens observations proximate to the cove area is presented as Table T-9 (*Summary of Sheen Observations in Proximity to Cove*) in **Appendix T**.

Sheen Fingerprint Samples

In June 2013, a sheen sample was collected by GZA personnel during a monitoring event and was submitted to New Fields Analytical Laboratory of Rockland, Massachusetts for fingerprint analysis. Results identified the sheen sample as “mixed petroleum oil tar and parking lot runoff”. A summary of the TPH sheen fingerprinting results is presented on Table T-10 (*Sheen TPH Fingerprinting Results*) in **Appendix T**.

Conclusions

Sheens have been consistently observed proximate to the cove area of the Site since at least 2011. A containment boom has been deployed in this portion of the Site since at least 2002. Significant source removal was conducted in this area in 2002 and an engineered cap was installed over the majority of the area. LNAPL was initially detected at thickness of up to 2 feet in 2005 but has consistently decreased since then and has been detected in only trace amounts since 2014. Sediment in the cove appears to have visual and olfactory evidence of impacts, with TPH fingerprinting as “fuel oil mixed with coal tar”.

The subsurface impacts detected, and significant upland remedial efforts completed to date indicate that observed sheens in the cove area are likely attributable to residual impacts in the sediment. Additional remedial efforts in the upland portions of the Site would not likely aid in decreasing the presence of sheens in the cove. The existing containment boom appears to be effective in limiting sheens in the cove from migrating off-Site, as very limited to no sheens have been observed outside the containment boom adjacent to the Site.

3.1.4.6 OXIDE BOX WASTE AREA

In January 2009, VHB on behalf of TNEC submitted to RIDEM a memo entitled *Oxide Box Waste Summary Memo* presenting a summary of investigations performed in the oxide box waste area, analytical testing results and VHB’s recommended remedial approach for the former oxide box waste area. VHB’s recommended remedial approach included soil removal and disposal and improving the area with an engineered cap. VHB assumed that the soil removed from the area would be acceptable for recycling via thermal desorption at ESMI Companies in Loudon, NH. As part of the 2014 investigation, GZA completed four (4) additional shallow soil borings (GZ-321S, GZ-322S, GZ-323S, and GZ-324S) in the oxide box waste area to further characterize the soil and groundwater impacts and to further evaluate the recommended remedial approach. The area is known as the “oxide box waste area” because of the presence of purifier box waste. The purifier box waste likely originates from the presence of the four (4) Former purifier tanks located in the oxide box waste area and in the area to the east. The following sections provide a background of the oxide box waste area, a discussion of the extent of impacts in the area (field screening and observations of impacted soils, soil impacts, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein.

Thirty-six (36) explorations were performed in the oxide box waste area, to depths ranging from 3.5 to 16 feet bgs. These explorations are shown on the attached Figure U-1 (*Exploration Location Plan*) in **Appendix U (Data Gap – Oxide Box Area)**. All of the explorations were performed for environmental purposes (RCA-11, E03, E04, E08, E09, E10, E11, E12, E13, E14, E15, E16, E17, E18, E19, C19, C20, C21, Test Pit E15, B-1 / VHB-18, B-2, B-2B, B-2C, B-2D, B-3, B-4 / VHB-19, B-8, VHB TP-100, VHB TP-101, VHB TP-102, VHB TP-103, VHB TP-104, GZ-321S, GZ-322S, GZ-323S and GZ-324S). B-2D was completed after refusal was encountered in B-2, B-2B and B-2C. Two monitoring wells were located in the area (RCA-11 and VHB-18) and were decommissioned in 2016 (as described below). An additional monitoring well was located in the area (VHB-19) but was noted as destroyed in 2011. Boring and test pit logs are included in **Appendix U**.

Field Screening and Observations of Impacted Soils

All the explorations completed in the oxide box waste area have been relatively shallow. Review of the logs indicates the presence of at least approximately 16 feet of fill. Other deeper borings proximate to the area consist of 15 to 20 feet of fill underlain by some intermittent organic silts, outwash deposits and glacial till. In general, the fill consists of sands and gravels with concrete and wood fragments, cinders, cinder ash, coke and coal fragments. Visual indicators of purifier box waste-like material were noted in many borings in the area. Purifier box waste is identified with blue or green staining, the presence of wood chips and a cyanide or naphthalene-like odors. Indicators of purifier waste were noted on the boring logs for RCA-11 (0-10 feet bgs), C20 (1-5 feet bgs), C21 (0.5-6.5 feet bgs), E09 (0.5-2.5 feet bgs), E15 (0-6 feet bgs), Test Pit E15 (0-4.5 feet bgs), B-1 (0-8 feet bgs), B-2 (0-4 feet bgs), B-2B (0-4 feet bgs), B-2C (0-6.5 feet bgs), B-2D (0-6 feet bgs), B-3 (1.25-4 feet bgs), B-4 (0-1.5 feet bgs), B-8 (0-2.5 feet bgs), VHB TP-100 (4-5 feet bgs), VHB TP-101 (4-7 feet bgs), VHB TP-102 (3-6

feet bgs), VHB TP-103 (3-5 feet bgs), VHB TP-104 (0-6 feet bgs), GZ-322S (2-3.5 feet bgs) and GZ-324S (2-5 feet bgs). TVOCs readings from these explorations ranged from ND to above the range of the instrument (more than 2,500 ppmv). Generally, TVOC readings were higher in the surface soils (0 to 2 feet bgs) and the near surface soils and were coincident with observations of purifier box waste (ranging from 2 to 6 feet bgs). TVOCs were generally ND at and below the water table (depths of approximately 6 to 8 feet bgs). Explorations located closer to the Compressor House No.2 (to the north; C19, E03, E04, E08, and GZ-321S) and closer to the location of Former Holder No.21 (to the west; E11, E12, E13, E14, E16, E17, E18, E19 and GZ-323S) generally did not note odors or other indications of impact. Refusal was noted in several explorations on apparent concrete in the area (likely remnants of the Former purifier tanks). These include C20 (three attempts to 1 feet bgs and final attempt at 5 feet bgs), E15 (6 feet bgs), B-2 (4 feet bgs), B-2B (4 feet bgs), B-2C (6.5 feet bgs), VHB TP-100 (5 feet bgs), VHB TP-101 (7 feet bgs), VHB TP-102 (7 feet bgs), and VHB TP-103 (4 feet bgs).

Surface Soils Analytical Results

Surface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and inorganic compounds. A total of eighteen (18) samples were submitted for analysis. The compounds that were detected in excess of the RIDEM I/C-DEC were TPH (240 – 40,000 mg/kg), arsenic (3 – 47.3 mg/kg), lead (5.4 – 515 mg/kg), Benzo [a] Pyrene (0.68 – 1.6 mg/kg) and naphthalene (0.67 – 15,400 mg/kg). Cyanide was detected in concentrations ranging from 0.8 to 62 mg/kg, far below the RIDEM I/C-DEC of 10,000 mg/kg. The compounds that were detected in excess of the RIDEM GB Leachability Criteria were benzene (0.11 – 27.2 mg/kg), toluene (0.034 – 194 mg/kg), and TPH (240 – 40,000 mg/kg). Naphthalene and TPH were detected in excess of the RIDEM UCLs in the sample collected from B-8 at a depth of 1-2 feet bgs. Exceedances of the RIDEM UCL and GB Leachability Criteria in the surface soils in this area are generally limited to this sample. The remainder of the I/C-DEC exceedances were detected across the oxide box area with no discernible pattern. Table U-1 (*Surface Soil Data*) in **Appendix U** presents the analytical surface soil data collected in this area.

Subsurface Soils Analytical Results

Subsurface soil samples collected were analyzed for TPH, SVOCs, VOCs, PCBs, pesticides, and inorganic compounds. A total of twenty-nine (29) samples were submitted for analysis. The compounds that were detected in excess of the RIDEM I/C-DEC were TPH (140 – 9,700 mg/kg), arsenic (10.3 – 13.6 mg/kg), Benzo [a] anthracene (0.558 to 110 mg/kg), Benzo [a] pyrene (0.261 – 70 mg/kg), Benzo [b] fluoranthene (0.638 – 100 mg/kg), Dibenzo [a,h] Anthracene (0.244 – 4.2 mg/kg) and Indeno [1,2,3-cd] Pyrene (0.433 – 29 mg/kg). Cyanide was detected in concentrations ranging from 0.066 to 197 mg/kg, far below the RIDEM I/C-DEC of 10,000 mg/kg. The compounds that were detected in excess of the RIDEM GB Leachability Criteria were benzene (0.0186 – 173 mg/kg), ethylbenzene (0.0217 – 159 mg/kg), toluene (0.0735 – 321 mg/kg), and TPH (140 – 9,700 mg/kg). RIDEM UCLs were not exceeded. Subsurface soil exceedances of the RIDEM I/C-DEC and the GB Leachability Criteria in this area are generally limited to the area directly proximate to GZ-324S. Table U-2 (*Subsurface Soil Data*) in **Appendix U** presents the analytical subsurface soil data collected in this area.

Groundwater and NAPL Gauging Results

There were two (2) active monitoring wells present directly within the area (RCA-11 and VHB-18). Based on historical elevation data from these monitoring wells, groundwater is expected to be encountered approximately 4 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for the wells within the area is presented in Table U-3 (*Groundwater and NAPL Gauging*) in **Appendix U**. LNAPL has been historically detected in trace amounts only in monitoring wells RCA-11 and VHB-18, with no LNAPL detected in either well since 2003. DNAPL has not been encountered in the oxide box area.

Groundwater Analytical Results

Nineteen (19) groundwater samples were collected from three (3) monitoring wells in the oxide box area between 1994 and 2016 and analyzed for VOCs, SVOCs, TPH and total cyanide. SVOCs or TPH have not been detected in the groundwater

samples collected in this area. Benzene was detected in excess of the RIDEM GB Groundwater Objectives in samples collected from VHB-18 between 2002 and 2008, however concentrations of benzene were not detected in either of the samples collected in 2009 and 2010. As noted above, VHB-18 was found damaged in 2011 and had not been sampled since then. Groundwater samples collected from RCA-11 and VHB-19 have relatively low levels of detected VOCs, with no elevated concentrations or exceedances of RIDEM criteria detected. Table U-4 (*Groundwater Analytical Data*) in **Appendix U** presents the analytical groundwater data collected in this area.

Conclusions

As described below, this area was capped with a geosynthetic liner system (LLDPE with an 8-ounce non-woven geotextile cushion layer above and below) overlain with new asphalt paving or a topsoil engineered cap. An approximate 10-foot by 10-foot excavation was completed at the location of B-08 to a depth of 3 feet bgs. This soil was recycled at ESMI in Loudon, NH.

As described above, these remedial activities were documented in the April 2017 *Short-Term Response Action Completion Report – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC, submitted to RIDEM on April 28, 2017.

3.1.4.7 MONITORING WELL RCA-3 DNAPL

Monitoring well RCA-3 was located in the north-central portion of the Site proximate to the cove, as shown on Figure V-1 (*Exploration Location Plan*) in **Appendix V** (*Data Gap – RCA-3 DNAPL*). Since 2001, DNAPL had been identified in RCA-3 at thickness ranging from trace to 0.17 feet (see Table V-4 (*Historical DNAPL Thickness*) of **Appendix V**). In 2014, GZA completed a deeper boring (GZ-313) at the location of RCA-3 and installed a deeper monitoring well (GZ-313D) to determine the vertical extent of DNAPL in this area. The following sections provide a background of the area proximate to RCA-3, a discussion of the extent of DNAPL impacts in the area (field screening and observations of impacted soils, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein. The RCA-3 area of the Site was utilized for coal and coke storage and is located cross-gradient of the Former Benzol Building, Former Ammonia Works and the Former Compressor House No.1. As shown on Figure V-1 in **Appendix V**, RCA-3 is directly proximate to an active oil water separator and associated drain lines which extend further into the Site (the majority of the Site drainage system is shown on Figure 3A). RCA-3 is also directly proximate to natural gas lines which extend further into the Site.

Twenty-two (22) explorations were performed proximate (for purposes of this discussion, limited to 100 feet in diameter) to RCA-3, to depths ranging from 6 to 117 feet bgs. These explorations are shown on the attached Figure V-1 in **Appendix V**. Four (4) explorations were performed for geotechnical purposes (B-61, B-62, B-70, and B-70A). Two (2) test pits were performed for waste characterization purposes (TP-36 and TP-37). Sixteen (16) explorations were performed for environmental purposes (RCA-3, RCA-R4, ETP-38, GZ-313D, VHB-4, MHA-4, MHA-5, B06, B07, B08, B09, B10, B11, B18, D93 and D94). Two monitoring wells were located in the area (RCA-3 and GZ-313D) and were decommissioned in 2016 (as described below). No analytical samples were collected from the geotechnical borings and information regarding visual and olfactory indicators of residuals is limited. The geotechnical borings ranged in depth from 31.5 to 117 feet bgs, while the environmental borings ranged in depth from 6 to 36 feet bgs. Logs from both the geotechnical and environmental borings are included as **Appendix V**. The boring logs for RCA-R4 and waste characterization test pit logs were not available in the reports reviewed by GZA. Additionally, locations collected for geotechnical sampling (CPT data, etc.) purposes only are not included in the context of this report. Please note that sampling depths that are noted in the following discussion are from the original grades. As noted previously, portions of the area have been remediated and capped and relative sampling depths are unknown. The discussion of impacts presented in the following paragraphs pertains to residual material remaining within the area limits following the remedial activities discussed previously based on GZA's review of available information.

Field Screening and Observations of Impacted Soils

Review of these boring logs proximate to RCA-3 indicates the presence of approximately 15 to 20 feet of fill underlain by intermittent organic silts, outwash deposits and glacial till. In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. Visual indicators of petroleum -like saturation were noted on the boring logs for RCA-3 (8-10 and 14-16 feet bgs), B07 (3.75-6 feet bgs), B-70 (10-11.5 feet bgs) and B-70A (10-15 feet bgs). Black staining was indicated on most borings in the fill layers. Visual indicators of MGP-like residuals (*i.e.*, blue/green/yellow staining) were not noted in this area. Visual indicators of coal tar -like saturation were noted on the boring logs for ETP-38 (7.5-8.5 feet bgs) and VHB-4 (8-12 feet bgs). Petroleum-like odors were noted in some borings located in this area (RCA-3, ETP-38, B07, B09, B11, MHA-4, and GZ-313D). Petroleum-like odors were generally noted coincident with the water table (depths of approximately 6 to 14 feet bgs). Coal tar-like odors were noted in two borings located in this area: RCA-3 (10-12 feet bgs) and VHB-4 (8-14 feet bgs). TVOCs readings from these borings ranged from ND to approximately 427 ppmv. Generally, TVOC readings increased with depth until approximately 2 feet below the water table and then subsequently decreased. Visual and olfactory evidence of coal tar-like impacts were not encountered in boring GZ-313D.

Soil TPH Fingerprint Results

Three (3) soil samples were submitted for TPH fingerprinting from RCA-3 (8-10 feet bgs), ETP-38 (8.5 feet bgs) and GZ-313D (18-20 feet bgs). The sample collected from RCA-3 was fingerprinted as “fuel oil”, the sample collected from ETP-38 was fingerprinted as “fuel oil mixed with coal tar” and the sample collected from GZ-313D was fingerprinted as “tar impacted hydrocarbons”. A summary of the TPH fingerprinting results is presented on Table V-1 (*Soil TPH Fingerprinting Results*) in **Appendix V**.

Groundwater and NAPL Gauging Results

There were two (2) monitoring wells located directly within the RCA-3 data gap investigation area (RCA-3 and GZ-313D). Based on historical elevation data from these monitoring wells, groundwater is expected to be encountered approximately 6 to 11 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for the wells within the area is presented in Table V-2 (*Groundwater and NAPL Gauging*) in **Appendix V**. Given the proximity to the cove, groundwater is expected to be tidally influenced (0.5 to 3.5 feet fluctuations have been observed). DNAPL had been historically detected in trace to 0.17 feet thicknesses in monitoring well RCA-3, with trace amounts only since 2002. DNAPL had not been encountered in GZ-313D. Both of these wells were decommissioned in 2016. A summary of historical DNAPL thicknesses in this area is presented on Table V-3 (*Historical DNAPL Thicknesses*) in **Appendix V**.

Groundwater Analytical Results

Fifteen (15) groundwater samples were collected from RCA-3 between 1994 and 2016 and submitted for analysis of VOCs, SVOCs, and TPH. One (1) groundwater sample was collected from GZ-313D in 2014 and submitted for analysis of VOCs. Naphthalene was detected in excess of the RIDEM GB Groundwater Objectives in one (1/15) sample collected from RCA-3 in 1994. Since 1994, groundwater samples collected from RCA-3 have had relatively low levels of detected VOCs and SVOCs with no elevated concentrations or exceedances of RIDEM criteria detected. The groundwater sample collected from GZ-313D had relatively low levels of VOCs detected with no elevated concentrations or exceedances of RIDEM criteria detected.

Groundwater samples were submitted for TPH analysis from RCA-3 in 1994 and 1996. The sample collected in 1994 had TPH detected at a concentration 27 mg/L and was fingerprinted as “fuel oil” and the sample collected in 1996 had TPH detected at a concentration of 11.9 mg/L and was fingerprinted as “a mixture of kerosene and PAHs in the C2-C3 range”.

Table V-4 (*Groundwater Analytical Data*) in **Appendix V** presents the analytical groundwater data collected in the area.

Conclusions

As noted above, the DNAPL that has been observed in RCA-3 is present in limited measurable thicknesses and does not appear to be mobile. DNAPL observations have been limited to trace quantities since 2002 and is not present in quantities that are recoverable. Dissolved phase groundwater impacts also have decreased since RCA-3 installation in 1994. GZ-313D was installed proximate to RCA-3 and indicated limited visual and olfactory evidence of impacts. The trace DNAPL that has been observed in RCA-3 is likely an isolated area and is very limited in extent and is not mobile.

3.1.4.8 MONITORING WELL RCA-21 LNAPL

Monitoring well RCA-21 was located in the LNG portion of the property, as shown on Figure W-1 (*Exploration Location Plan*) in **Appendix W** (*Data Gap – RCA-21 LNAPL*). RCA-21 was installed in 1996 by RCA as part of the Phase 1B Site Investigation activities. Remedial activities were completed in this area during 2001 and are documented in the November 2002 *Remedial Action Closure Report* prepared by VHB (as presented in **Appendix AA**). Remedial activities included significant source removal in the area downgradient of RCA-21 and the installation of an engineered cap over the area surrounding RCA-21. As presented in Table W-3 (*Historical LNAPL Thicknesses*) and Table W-4 (*Historical LNAPL Thicknesses and Recovery – RCA-21/RW-1*) in **Appendix W**, and further described below, measurable and recoverable thicknesses of LNAPL had been detected at RCA-21 between 2001 and 2014 (with thicknesses overall decreasing with time). To further define the extent of LNAPL in the area, GZA completed a test pit at the location of RCA-21 (TP-301) and replaced RCA-21 with a recovery well (RW-1) on June 17, 2014. Between 2014 and 2016, LNAPL was detected in RW-1 in thicknesses ranging from trace amounts to 0.02 feet. The following sections provide a background of area proximate to RCA-21, a discussion of the extent of LNAPL impacts in the area (field screening and observations of impacted soils, groundwater impacts and NAPL impacts) and our conclusions based on the information presented herein.

Twenty-five (25) explorations were performed proximate (for purposes of this discussion, limited to 100 feet in diameter) to RCA-21, to depths ranging from 6 to 96.5 feet bgs. These explorations are shown on the attached Figure W-1 in **Appendix W**. Four (4) explorations were performed for geotechnical purposes (B-21, B-22, SB-02, and SB-04). Seven (7) test pits were performed for waste characterization purposes (TP-2, TP-4, TP-9, TP-28, TP-29, TP-30, and TP-31). Three (3) recovery wells were installed (CHES RW-4, CHES RW-5 and RW-1). Eleven (11) explorations were performed for environmental purposes (RCA-21, RCA-21R1, RCA-40, RCA-R10, RCA-R11, RCA-R19, B35, B36, B45, B46 and TP-301). Two (2) monitoring wells and three (3) recovery wells were located proximate to RCA-21 (RCA-21, RCA-40, CHES RW-4, CHES RW-5 and RW-1). RCA-21R was the first attempt at drilling RCA-21; refusal was encountered at a depth of 5 feet and RCA-21 was relocated to the north. Four wells were located in the area (CHES RW-4, CHES RW-5, RW-1 and RCA-40) and were decommissioned in 2016 (as described below). No analytical samples were collected from the geotechnical borings and information regarding visual and olfactory indicators of residuals is limited. The geotechnical borings ranged in depth from 51 to 96.5 feet bgs, while the environmental borings ranged in depth from 6 to 20 feet bgs. Logs from both the geotechnical and environmental borings are included as **Appendix W**. The boring logs for RCA-R10, RCA-R11 and RCA-R19, waste characterization test pit logs or installation logs for recovery wells CHES RW-4 and CHES -5 were not available in the reports reviewed by GZA. Additionally, this report does not include any locations collected for geotechnical sampling (CPT data, etc.) purposes only.

Field Screening and Observations of Impacted Soils

Review of these boring logs indicates the presence of approximately 15 to 20 feet of fill underlain by organic silts, outwash deposits and glacial till. In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. Visual indicators of petroleum-like saturation were noted on the boring logs for RCA-21 (10-14 and 16-19 feet bgs), RCA-40 (8-10 feet bgs) and TP-301 (11-13 feet bgs). Black staining was indicated on most borings in the fill layers. Visual indicators of MGP-like residuals (*i.e.*, blue/green/yellow staining) were not noted in this area. “Asphaltic odors” were noted in boring RCA-40 from 16 to 20 feet bgs. Petroleum-like odors were noted in most borings located in the RCA-21 area (B-21, B-22, RCA-21, RCA-40, TP-301, SB-02 and SB-04). Petroleum-like odors were generally noted coincident with the water table

(depths of approximately 6 to 14 feet bgs). TVOCs readings from these borings ranged from ND to approximately 303 ppmv. Generally, TVOC readings increased with depth until approximately 2 feet below the water table and decreased thereafter. Borings located closer to the present-day foam building to the west of the truck skid (B35, B36, B45, and B46) generally did not note odors, petroleum-like or other indications of impacts. Refusal was noted in RCA-21R1 (10.5 feet bgs). There was no evidence of concrete or other structures in TP-301 which was completed in the location of RCA-21/21R.

Soil TPH Fingerprint Results

Three (3) soil samples were submitted for TPH fingerprinting from RCA-21 (4-6 and 8-10 feet bgs) and RCA-40 (8-10 feet bgs). The samples from RCA-21 (4-6 feet bgs) and RCA-40 (8-10 feet bgs) were identified as "Fuel Oil No.2" and the sample from RCA-21 (8-10 feet bgs) was identified as "Fuel Oil mixed with Coal Tar". A summary of the TPH fingerprinting results is presented on Table W-1 (*Soil TPH Fingerprinting Results*) in **Appendix W**.

The water table is approximately 6-14 feet bgs, depending on seasonal variations and tidal fluctuations. Based on visual and olfactory observations of impacts and TPH fingerprinting results, more petroleum-like impacts are noted at and above the water table, while a mix of petroleum-like and coal tar-like impacts were noted below the water table.

Groundwater and NAPL Gauging Data

There were two (2) monitoring wells present directly within the area (RCA-21 and RCA-40) and three (3) active recovery wells (CHES RW-4, CHES RW-5 and RW-1). As noted above, RCA-21 was replaced with RW-1 in 2014. The other four wells that were located in this area (CHES RW-4, CHES RW-5, RW-1 and RCA-40) were decommissioned in 2016 (as described below). Based on elevation data from these monitoring wells, groundwater is expected to be encountered approximately 6 to 11 feet bgs in the area. A summary of groundwater elevation and NAPL gauging data for the wells within the area is presented in Table W-2 (*Groundwater and NAPL Gauging*) in **Appendix W**. As noted above, groundwater is expected to be tidally influenced (0.5 to 3.5 feet fluctuations have been observed). LNAPL has been historically detected in the area in thicknesses ranging from trace amounts to 3.58 feet. DNAPL has not been historically detected in the area.

LNAPL was detected in RCA-21 in thicknesses ranging from 0.58 to 3.58 feet between 2011 and June 2014. LNAPL has been detected in RW-1 in thicknesses ranging from trace to 0.02 feet between June 2014 and May 2016. Between 2002 and 2016, LNAPL was observed in CHES RW-4, CHES RW-5 and RCA-40 in thickness ranging from trace to 2 feet. Since 2006, LNAPL has not been observed in thicknesses of more than 0.1 feet in these wells (CHES RW-4, CHES RW-5 and RCA-40). Table W-3 (*Historical LNAPL Thicknesses*) in **Appendix W** presents a summary of historical LNAPL thicknesses observed in the remaining monitoring wells proximate to RCA-21.

GZA gauged and recovered LNAPL from RCA-21 on an at least monthly basis during the rest of the second half of 2011, 2012, 2013 and the first half of 2014. During monthly gauging and recovery between 2011 and early 2014, the thickness of LNAPL was detected at thickness ranging from 0.07 to 1.89 feet, with the average thickness detected at over 1.2 feet and average recovery was approximately 1 gallon of LNAPL/water per month. During the first half of 2014, the LNAPL thickness was observed to decrease to less than 1 feet, with thicknesses ranging from 0.58 to 0.99 feet. RCA-21 was not gauged between 2003 and 2010, so historical records are limited. However, in 1996, RCA-21 gauging results indicated 0.58 feet in March 1996 and 0.23 feet in May 1996. As noted above, RCA-21 was replaced with RW-1 to aid in the recovery of LNAPL in June 2014. Between the 2014 installation of RW-1 and the decommissioning of RW-1 in May 2016, LNAPL was detected at thicknesses ranging from trace and 0.02 feet. Table W-4 *Historical LNAPL Thicknesses and Recovery – RCA-21/RW-1* in **Appendix W** presents a summary of LNAPL thicknesses and recovery of RCA-21/RW-1.

Groundwater Analytical Results

Four (4) groundwater samples were collected in the area proximate to RCA-21 between 1994 and 2005 and analyzed for VOCs, SVOCs, and TPH. Groundwater sampling has not been conducted in this area since 2005. Naphthalene was detected

in excess of the RIDEM GB Groundwater Objectives in a sample collected from RCA-21 in 1996. Table W-5 (*Groundwater Analytical Data*) in **Appendix W** presents the analytical groundwater data collected in the area.

Groundwater TPH Fingerprinting Results

Two of the four groundwater samples collected from the area were submitted for TPH analysis (one from RCA-21 and one from RCA-40). TPH was detected in both RCA-21 and RCA-40 groundwater samples at concentrations of 595 and 281 mg/L, respectively. Both samples were fingerprinted as “Fuel Oil”. Table W-6 (*Groundwater TPH Fingerprinting Results*) in **Appendix W** presents the groundwater TPH fingerprinting data collected in the area.

Conclusions

As noted, LNAPL was detected in other monitoring wells that are approximately within 100 feet of RCA-21 (CHES RW-4, CHES RW-5, and RCA-40), but in much lesser thicknesses. LNAPL was observed to begin to decrease in thickness during monthly gauging and recovery of RCA-21 between 2011 and 2014 and has only been detected in thicknesses of equal to or less than 0.02 feet in the replacement recovery well (RW-1) between 2014 and 2016. The LNAPL thickness that was observed in RCA-21 is likely an isolated source and does not appear to be migrating to the Providence River or off-Site.

3.1.4.9 DEEPER SITE INVESTIGATION

In general, environmental explorations completed at the Site have generally been shallow, extending to depths of approximately the water table (generally 4 to 8 feet bgs), regardless of the level of impacts noted during advancement. Several locations were identified with possible impacts at depth: proximate to VHB-1, proximate to RCA-3 (B-70A), proximate to the Former Compressor Building No. 1 near VHB-7 (SWBL-2, SWBL-6, SWBL-7, SWBL-8, B-37, B-43, GZA-205, and GZA-216), proximate to VHB-21, proximate to the LNG Vaporizer Building near ESS RW-3, 4, 5, and 6 (SWBL-9A, SWBL-14 and B-53), and proximate to the LNG generator area near VHB-20 (GZA-207 and GZA-208). In general, many of these borings indicate visual and olfactory impacts in the fill layer approximately 20 to 30 feet bgs, above the silt layer. GZA installed fourteen (14) additional deeper borings during 2014 to define the nature and extent of deeper impacts at the Site.

The following sections provide a background of the deeper investigation data, a discussion of the extent of impacts detected at depths of more than 20 feet (visual and olfactory impacts, groundwater and NAPL gauging results, groundwater analytical results and NAPL impacts) and our conclusions based on the information presented herein. Only data collected from borings that extended to a depth of 30 feet bgs or more are included in this section.

One hundred and forty-four (144) explorations were performed at the Site to depths greater than 30 feet bgs, to depths ranging from 30 to 174 feet bgs. These explorations are shown on the attached Figure X-1 (*Exploration Location Plan – Western Side of Site*) and Figure X-2 (*Exploration Location Plan – Eastern Side of Site*) in **Appendix X (Data Gap – Deeper Borings)**. One hundred and thirty (130) explorations were performed for geotechnical purposes (PGC-9, B-1, B-2, B-3, B-4, B-4A, B-5, B-6, B-7A, B-8, B-9, B-10, B-11, B-20, B-21, B-22, B-23, B-24, B-25, B-26, B-27, B-28, B-29, B-30, B-31, B-32, B-33, B-34, B-35, B-36, B-37, B-38, B-39, B-40, B-41, B-42, B-43, B-50A, B-51, B-52, B-53, B-60, B-61, B-62, B-63, B-64, B-65, B-66, B-70, B-70A, B-71, B-72, B-73, B-73A, B-74, B-76, B-77, B-78, B-79, B-80, B-100, B-102, B-201, B-204, B-205, B-206, B-207, B-212, SWBL-1, SWBL-2, SWBL-3, SWBL-4, SWBL-6, SWBL-8, SWBL-9A, SWBL-10, SWBL-11A, SWBL-12, SWBL-13, SWBL-14, SWBL-15, SWBL-16, SWBL-17, SWBL-18, GZ-1, GZ-2, GZ-3, GZ-5, GZ-7C, GZ-7E, GZ-101, GZ-102, GZ-201, GZ-202A, GZ-203, GZ-204A, GZ-205, GZ-206, GZ-207, GZ-208, GZ-209, GZ-210, GZ-211, GZ-212, GZ-213, GZ-214, GZ-215, GZ-216, GZ-217, SB-01, SB-02, SB-04, SB-06, Golder B-201, Golder B-202, Golder B-203, Golder B-204, Golder B-205, Golder B-206, Golder B-207, Golder B-208, Golder B-209, Golder B-210, Golder B-211, Golder B-212, PPS B-1, PPS B-2, GZ B-1, GZ B-2, GZ B-3, PRV-1, PRV-2, PRV-3, PRV-4 and PRV-5). Fifteen (15) explorations were performed for environmental purposes (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-310, GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D, GZ-319D, and GZ-320D). Fourteen (14) “deep” monitoring wells were installed (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D, GZ-319D, and GZ-320D). Seven (7) “deep” wells (GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D and GZ-320D) were decommissioned in 2016

(as described below). Only TPH analytical fingerprinting samples were collected from the environmental borings. No analytical samples were collected from the geotechnical borings and information regarding visual and olfactory indicators of residuals and field screening results is limited. The geotechnical borings ranged in depth from 31.5 to 174 feet bgs, while the environmental borings ranged in depth from 30 to 36 feet bgs. Logs from both the geotechnical and environmental borings are included as **Appendix X**. This report does not include any locations collected for geotechnical sampling (CPT data, etc.) purposes only.

Field Screening and Observations of Impacted Soils at Depth

Review of these boring logs indicates the presence of approximately 15 to 20 feet of fill underlain by organic silt or peat, outwash deposits and glacial till. In general, the fill consists of sands and gravels with cinders, cinder ash, coke and coal fragments. The organic silt layer is not contiguous over the whole Site but is encountered in thicknesses of up to 60 feet closer to the Providence River, proximate to the LNG facility. Bedrock was not encountered in any of the explorations completed at the Site and is estimated to be more than 170 feet bgs.

Visual and olfactory indicators of petroleum-like impacts were noted in many areas of the Site closer to the natural water table. As noted above, many existing borings at the Site were terminated within vertical zones of visual and olfactory evidence of impacts. This section is intended to delineate the extent of detected impacts at depth.

The non-contiguous organic silt/peat layer at the Site appears to be acting as a “confining layer” to prevent impacts from migrating vertically and evidence of this pattern was noted in many borings across the Site (B-4, B-6, B-7A, B-8, B-21, B-22, B-24, B-28, B-37, B-38, B-43, B-60, B-70, B-70A, B-71, B-72, B-73, B-74, SWBL-1, SWBL-3, SWBL-9A, GZ-7, GZ-201, GZ-203, GZ-216, GZ-303D, GZ-304D, GZ-309D, GZ-310, GZ-311D, GZ-312D, GZ-314D, GZ-315D, GZ-318D, GZ-320D, SB-01, SB-02, SB-04, SB-06, B-201, B-202, B-203, B-204, PRV-1, PRV-2, PRV-3, PRV-4 and PRV-5).

More shallow impacts were noted in several borings without a “confining layer” and generally limited to overlying fill (B-64, SWBL-16, GZ-204A, GZ-209, GZ-210, GZ-212, GZ-213, GZ-214, GZ-302D, GZ-313D, GZ-319D, B-205, B-206, B-208, B-209, B-211, B-211 and B-212).

Deeper impacts (ranging from 25 to 55 feet bgs) were noted in several borings (B-41, SWBL-4, SWBL-6, SWBL-10, SWBL-12, SWBL-13, SWBL-14, GZ-202A, GZ-205, GZ-207, GZ-208, B-210, PPS B-1, PPS B-2 and GZ B-2), which appear to be generally vertically confined by glacial till in the area. Of these borings, most of these deeper impacts (45 to 55 feet bgs) were noted in explorations (SWBL-6, SWBL-10, SWBL-12, SWBL-13, SWBL-14, B-210, PPS B-2, and GZ B-2) performed downgradient of Former Compressor House No.1 and/or historical tar pits/wells/tanks and appear to be vertically confined by the glacial till.²¹Groundwater and NAPL Gauging Data

Fourteen (14) monitoring wells were screened at depths greater than 20 feet bgs (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D, GZ-319D, and GZ-320D) at the Site. As noted above, seven (7) “deep” wells (GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D and GZ-320D) were decommissioned in 2016 (as described below). Each of these monitoring wells were gauged at least seven (7) times between 2014 and 2016. NAPL was not detected. Table X-2 (Summary of *Groundwater and NAPL Gauging Results*) in **Appendix X** presents the groundwater and NAPL gauging results.

Several monitoring well couplets were installed at the Site (RCA-12R and GZ-301D, GZ-302S and GZ-302D, GZ-303S and GZ-303D, RCA-12R and GZ-304D, VHB-1 and GZ-309D, VHB-10 and GZ-320D, VHB-3 and GZ-311D, GZ-312S and GZ-312D, RCA-3 and GZ-313D, VHB-21 and GZ-318D, VHB-20 and GZ-319D, GZ-314S and GZ-314D and RCA-5 and GZ-315D). The data

²¹ Note that GZA attempted to install a deeper environmental boring in this area in 2014 (GZ-317D) but hit refusal many times. There are many obstructions in this area of the Site.

generally indicates that groundwater flow at the Site has a generally intermittent (upward and downward) component of flow, which indicates that the majority of wells on Site are likely at least slightly tidally influenced.

Groundwater Analytical Results

Forty-seven (47) groundwater samples were collected from these “deep” wells (GZ-301D, GZ-302D, GZ-303D, GZ-304D, GZ-309D, GZ-311D, GZ-312D, GZ-313D, GZ-314D, GZ-315D, GZ-318D, GZ-319D, GZ-320D, and GZ-500D) between 2014 and 2022 and analyzed for VOCs. Naphthalene and benzene were detected in excess of the RIDEM GB Groundwater Objectives in samples collected from monitoring wells GZ-314D (screen depth of 24 to 34 feet bgs – organic silt), GZ-315D (screen depth of 20 to 30 feet bgs – organic silt) and GZ-318D (screen depth of 20 to 30 feet bgs – organic silt). Vinyl chloride was detected in excess of the RIDEM GB Groundwater Objectives in a sample collected from GZ-301D (screen depth of 20 to 30 feet bgs – peat / organic silt / outwash sands).²²

Table X-1 (*Groundwater Analytical Data*) in **Appendix X** presents the analytical groundwater data collected in the area.

Conclusions

In general, historical environmental explorations completed at the Site have generally been shallow, extending to depths of approximately the water table (generally 4 to 8 feet bgs). As noted above, the soils at the Site generally consist of fill, underlain by a non-contiguous layer of organic silt / peat, outwash and glacial till. Results of recent Supplemental SI investigations indicate that deeper impacts were noted proximate to Former Compressor House No. 1 (close to the center of the Site), which appear to be vertically limited to the depth of the glacial till in the area (approximately 55 feet bgs). Impacts at depth were limited to 30-35 feet bgs in other areas of the Site and appear to be vertically confined by the presence of organic silt / peat in the area. The organic silt / peat at the Site has generally been detected closer to the Providence River at shallower depths than the glacial till and is likely limiting the horizontal migration of any deeper impacts to the Providence River.

In conclusion, although deeper impacts were detected in the central portion of the Site, the impacts appear to be horizontal and vertically limited and do not appear to be migrating off Site.

3.2 GROUNDWATER MONITORING PROGRAM (2003 – 2022)

VHB (on behalf of the NEG) implemented a groundwater monitoring program at the Site in 2003. The groundwater monitoring program was briefly described in the December 1998 *RAWP* submitted to RIDEM. The following reports have been submitted to RIDEM to present results of the groundwater monitoring:

- *Groundwater Monitoring Report – 2003 to 2005* prepared by VHB on behalf of TNEC dated December 2005;
- *Groundwater Monitoring Report – 2008* prepared by VHB on behalf of TNEC dated June 2008;
- *Groundwater Monitoring Report – 2009* prepared by GZA on behalf of TNEC dated February 2010;
- *Groundwater Monitoring Report – 2010* prepared by GZA on behalf of TNEC dated August 2010;
- *Groundwater Monitoring Report – January to June 2011* prepared by GZA on behalf of TNEC dated July 2011;
- *Groundwater Monitoring Report – July to December 2011* prepared by GZA on behalf of TNEC dated September 2012;

²² Vinyl chloride is not expected to be a constituent of concern associated with the Site. The detection of vinyl chloride at the Site is expected to be from off-Site impacts.

- *Groundwater Monitoring Report-2012* prepared by GZA on behalf of TNEC dated August 2013;
- *Groundwater Monitoring Report-2013* prepared by GZA on behalf of TNEC dated September 2014;
- *Groundwater Monitoring Report – 2014 through 2017* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Monitoring Report – 2018* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Monitoring Report – 2019* prepared by GZA on behalf of TNEC dated January 2021;
- *Groundwater Report – 2020* prepared by GZA on behalf of TNEC dated February 2021;
- *Groundwater Monitoring Report – 2021* prepared by GZA on behalf of TNEC dated September 2022; and
- *Groundwater Monitoring Report – 2022* prepared by GZA on behalf of TNEC dated June 2023.

The most significant groundwater impacts (dissolved phase and observations of NAPLs) were observed in areas at the Site generally coincident with areas proximate to Former MGP operations and subsurface soil impacts. In these locations, NAPLs and benzene, ethylbenzene, toluene and naphthalene were consistently present at concentrations above the GB Groundwater Objective. No exceedances have been observed in large areas of the Site, including the northern and eastern portions of the Site along the Providence River and the southeastern portion of the Site proximate to the area occupied by Holcim. Results of groundwater monitoring have generally remained consistent at the Site.

A summary of the groundwater monitoring conducted at the Site between 2003 and 2022 is included in **Appendix E** (*Summary of Regular Groundwater Monitoring (2003 through 2022)*). For further information related to groundwater monitoring, please refer to the reports previously referenced.

3.3 GROUNDWATER MONITORING WELL DECOMMISSIONING AND REPLACEMENT ACTIVITIES

3.3.1 Monitoring Well Decommissioning

As presented in the May 26, 2016 *Proposed Upcoming Groundwater Monitoring Activities Letter* prepared by GZA on behalf of TNEC which was submitted to RIDEM, several large facility projects were proposed at the Site over several years which required the closure of certain monitoring wells at the Site. Following submittal of this letter to RIDEM, TNEC initiated well closure activities in advance of the Holder 18/21 Capping Project (Section 4.4); Dike Access Road project (Section 4.5) and Liquefaction Project (Section 4.6). Monitoring well closure activities were conducted at the Site between June 27, 2016 and July 9, 2016. TNEC decommissioned forty-two (42) of the seventy-five (75) available monitoring wells located at the Site: RCA-3, RCA-5, RCA-11, RCA-14, RCA-20, RCA-29, RCA-32, RCA-33, RCA-38, RCA-40, VHB-3, VHB-6, VHB-7, VHB-8R, VHB-10, VHB-13, VHB-18, VHB-21, VHB-22, VHB-23, CHES RW-1, CHES RW-2, CHES RW-3, CHES RW-4, CHES RW-5, RW-1, ESS RW-1, ESS RW-2, U-1, GZ-204, GZ-216, GZ-311D, GZ-312D, GZ-312S, GZ-313D, GZ-314D, GZ-314S, GZ-315D, GZ-318D, GZ-320D, GZ-401, and GZ-403. Two (2) inactive monitoring wells (RCA-7 and RCA-13) were also decommissioned during this effort. Locations of the monitoring wells that were decommissioned are depicted on Figure 5A (*Groundwater Monitoring Wells*). The wells were abandoned by Geologic Earth Exploration, Inc. of Norfolk, Massachusetts²³. Consistent with Appendix 1 of the Rhode Island Water Quality Rules (<http://www.dem.ri.gov/pubs/regs/regs/water/gwqual10.pdf>), the monitoring wells were abandoned via splitting or removing the PVC well casing and then filling the remaining borehole with grout. Additionally, as part of the seawall/bulkhead repair

²³ TNEC received a CRMC FONSI for the monitoring well decommissioning work. A copy of the CRMC permit is provided in Appendix I (*CRMC Permit A2016-06-007 – Well Decommissioning Activities*).

project, monitoring well GZ-201 was temporarily decommissioned in accordance with the Water Quality Rules. Logs documenting the well abandonment activities are presented in **Appendix H (Well Decommissioning Logs)**.

3.3.2 Monitoring Well Replacement

Following completion of certain facility work, several of the monitoring wells that were decommissioned in 2016 were replaced. Monitoring well replacement work was completed in phases under the July 2021 and December 2022 *Replacement Monitoring Wells Installation Work Plans* submitted to RIDEM.

2021 Replacement Program

In accordance with the July 2021 Work Plan, five (5) replacement monitoring wells were installed (GZ-500S, GZ-500D, GZ-501S, GZ-502S, and GZ-503S) in September 2021, to replace select monitoring wells within the former Holder 18/21 area (RCA-11, VHB-8R, VHB-10, VHB-18, GZ-320D, GZ-401, and GZ-403) and to supplement existing monitoring well coverage across the Site.

Replacement monitoring wells (GZ-500S, GZ-501S, GZ-502S) were installed on September 14, 2021, and replacement monitoring wells (GZ-500D and GZ-503S) were installed on September 15, 2021. All the newly installed wells were developed (removal of sediment build-up in the well) in September 2021 using the surge/ bailing and pumping technique. The wells were developed until the turbidity level was <5 NTU. GZA generated a total of seventy-six (76) gallons of purge water during well development which was containerized in 55-gallon drums for off-Site disposal. Groundwater samples were collected from the newly installed wells as part of the November 2021 sampling event. A summary of the monitoring well installation (including installation logs) is included in the 2021 Monitoring Report submitted to RIDEM on September 9, 2022.

2023 Replacement Program

In accordance with the December 2022 Work Plan, nine (9) replacement monitoring wells were installed (GZ-311DR, GZ-313DR, GZ-315DR, GZ-318DR, RCA-3R, RCA-5R, VHB-3R, VHB-21R, and VHB-22R) as shown on the attached **Figures 5A and 5B**. All nine explorations were executed via push driven Geoprobe methods. Wells GZ-311DR, GZ-313DR, GZ-315DR, GZ-318DR, RCA-3R, RCA-5R, VHB-3R, VHB-21R, and VHB-22R were installed in February 2023.

All borings were in advanced of a depth of approximately 15 feet below ground surface (bgs), except for GZ-311DR, GZ-313DR, GZ-315DR, and GZ-318DR which were advanced to approximately 30 feet bgs. Borings were performed via GeoProbe drilling techniques with dedicated continuous sampling sleeves. A GZA field engineer was onsite to record boring activities, collect samples for field screening and characterization, and complete boring logs at each location. The recovered soil from each sample interval was logged using modified Burmeister classification system, field-screened for presence of total volatile organic compounds (TVOCs) with a Photoionization Detector (PID) and evaluated for the presence of staining and odors. GZA also performed photo-documentation of each soil sampling interval. As these were replacement monitoring wells, no analytical testing for soil was conducted.

The wells were constructed of 2-inch diameter Schedule 40 PVC in accordance with standards specified in Rhode Island Water Quality Regulations (<https://rules.sos.ri.gov/regulations/part/250-150-05-3>) to a total depth of approximately 15 feet below ground surface (bgs) (shallow wells RCA-3R, RCA-5R, VHB-3R, VHB-21R, and VHB-22R) or 30 feet bgs (deep wells GZ-311DR, GZ-313DR, GZ-315DR, and GZ-318DR). For each shallow well, the screen was set to span the natural water table encountered during drilling (typically within the fill unit or underlying sand unit – assumed to be approximately 10 to 12 feet bgs). For the deep well, the screen was set with midpoint at least 10 feet below the natural water table encountered during drilling. A sand filter pack was installed in the annular space around the well screen and extended approximately 1-foot above the well screen. An approximate 1-foot (minimum) bentonite seal was placed above the filter pack and the remaining borehole above the bentonite was backfilled with clean filter sand. Wells GZ-311DR, GZ-313DR, GZ-315DR, GZ-318DR, RCA-3R, RCA-5R, VHB-3R, VHB-21R, and VHB-22R were completed with road boxes.

All the newly installed wells were developed (removal of sediment build-up in the well) in March 2023 using the surge/ bailing and pumping technique. The wells were developed until the turbidity level was <5 NTU. GZA generated a total of one-hundred and fifty-one (151) gallons of purge water during well development which was containerized in 55-gallon drums for off-Site disposal. Groundwater samples will be collected from the newly installed wells as part of the 2023 sampling event. Boring logs for the installation of these monitoring wells are included in **Appendix Z**.

As part of the seawall/bulkhead repair project (completed November 2023) one well, GZ-201 was decommissioned to accommodate construction activities. The contractor for the bulkhead project J. F. Brennan, Inc. subcontracted Geologic Earth Exploration Inc. to reinstall GZ-201 at the end of the project and installed an additional well at the Holcim Facility (GZ-202). These two wells were installed with a geoprobe drill rig. The well installation logs are included in **Appendix Z**.

4.0 COMPLETED REMEDIAL ACTIONS (1995 – 2022)

Several remedial actions were completed at the Site between 1995 and 2002 by PGC and NEGC. Remedial actions included UST closure activities, source removal, soil excavation and capping. These activities have been documented in reports previously submitted to RIDEM. Figure 7 depicts the areas of the Site where remedial activities have been performed and Figure 8 presents the location of installed RIDEM-approved engineered caps (or equivalent). Remedial activities conducted between 1998 and 2001 were completed consistent with the December 1998 RIDEM-approved *RAWP* or subsequent modifications. The following reports were prepared to present results of these remedial actions:

- *Condensate Tank Closure Status Report and Remedial Action Plan for Compressor Building No. 2* prepared by RCA on behalf of PGC dated February 1995;
- *UST Closure Assessment* prepared by HEI on behalf of the PGC dated October 1995;
- *Remedial Action Report for Short Term Measure Performed at the Providence Gas Company* prepared by RCA on behalf of PGC dated June 1996;
- *UST Closure Assessment* prepared by HEI on behalf of the PGC dated September 1998;
- *Subsurface Investigation and Proposed Remediation Algonquin Generator Construction Area* prepared by ESS on behalf of the PGC dated October 1999;
- *Summary Letter* prepared by PGC dated May 2001;
- *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC dated November 2002;
- *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC dated December 2002;
- *SIR* prepared by VHB on behalf of the NEGC dated April 2003;
- *Holder 18/21 Capping Project Short Term Response Action Completion Report* prepared by GZA on behalf of TNEC dated April 2017;
- *Dike Access Road Short Term Response Action Completion Report* prepared by GZA on behalf of TNEC dated February 2020; and

- *Fields Point Liquefaction Project Short Term Response Action Completion Report* prepared by GZA on behalf of NGLNG LLC dated March 2023.

A summary of each of these completed remedial actions is included in **Appendix F** (*Summary of Completed Remedial Actions (1995 through 2002)*). For further information related to these completed remedial actions, please refer to the reports previously referenced.

In addition to the above, several more recent remedial actions have been completed at the Site between 2010 and 2022. These activities have been completed by TNEC and documented in reports submitted to RIDEM, as summarized in more detail below. Figure 7 depicts the areas of the Site where these remedial activities were completed, and Figure 8 presents the location of completed RIDEM-approved engineered caps and engineered controls.

4.1 DEMOLITION AND DECOMMISSIONING OF GASHOLDERS NOS. 18 AND 21

Former Gasholder No. 18 was built in 1911 and measured approximately 220 feet in diameter and 28 feet tall in the “closed” position (6 MMcf). Former Gasholder No. 21 was built in 1947 and measured approximately 163 feet in diameter and 40 feet tall in the “closed” position (3 MMcf). When MGP operations ceased at the Site, both Gasholders were utilized for storage of natural gas until the 1980s.

Between August 18, 2009 and May 19, 2010, TNEC completed the decommissioning and demolition of the two Former Gasholders. In general, this work included Site preparation; Gasholder dewatering, water treatment, and discharge to the sanitary sewer; sludge removal and dewatering; waste characterization; waste management; demolition; demolition material management; backfill and Site restoration, final Site cleaning, and demobilization.

The response action was documented in the *July 2010 Construction Completion Report for Demolition and Decommissioning of Gasholders Nos. 18 and 21* prepared by Brown and Caldwell on behalf of TNEC.

4.2 DRAINAGE REHABILITATION AREA

In February of 2012, RIDEM notified TNEC that they had noted a “sheen” in a catch basin (CB-01) located in the northwestern portion of the Site while investigating a release to the Providence River to the north of the Site. TNEC and RIDEM sampled the catch basin to characterize the impacts and deployed oil snares and absorbent booms as a temporary response action. In March of 2012, TNEC contracted Inland Waters to perform a camera survey of the lines associated with the catch basin. The catch basin was determined to flow in a westerly direction (towards Allens Avenue) and is connected to only one upgradient catch basin. The upgradient catch basin (CB-02) had evidence of closed connections. Based on review of available information, it was surmised that this piping connected to former buildings on Site. The flow eventually discharges to a manhole (MH-1) in the northwestern corner of the Site. This manhole discharges to a 102” diameter sanitary sewer line located in Allens Avenue which eventually discharges to the NBC Wastewater Treatment Plant located on Ernest Street in Providence, RI. Evidence of sheen / product was also noted within the manhole structure at a depth of approximately 14.5 feet bgs on the western wall of MH-1.

In response to these observations, GZA collected samples of the sheen / product from the catch basins (CB-01 and CB-02) and MH-1; refer to Figure 3A. A product sample was collected from MH-1 in December 2012 and sheen samples were collected from both CB-02 and CB-01 in February and March 2012. The sheen samples were analyzed by New Fields Laboratory of Rockland, Massachusetts and were identified as being comprised of complex mixtures of variably weathered petroleum, with the major component being “middle distillate petroleum” (i.e., diesel fuel, or fuel oil #2). The source of this sheen / product is unknown. Laboratory reports from New Fields Laboratory are included in **Appendix O** (*New Fields Chemical Fingerprinting Results*) (noted as May 25, 2012 New Fields Chemical Fingerprinting Summary Letter and Analytical Report and March 21, 2013 New Fields Chemical Fingerprinting Summary Letter and Analytical Report).

To address the observed sheens, TNEC performed certain rehabilitation activities of the on-Site drainage system in the northwestern corner of the Site between May 2012 and January 2013. These activities consisted of cleaning and in-situ sealing of the drainage structures and piping associated with the stormwater system between MH-1 and CB-02. Rehabilitation activities were completed by Inland Waters of Johnston, Rhode Island. Prior to the in-situ sealing of the interior portions of the catch basin structures, the structures were thoroughly cleaned. The initial cleaning consisted of vacuum extraction and excavation of water, sediment, and foreign debris from all drainage structures. Following the cleaning process, catch basins and manhole structures were sealed in place to mitigate groundwater intrusion utilizing acrylamide grout, hydraulic cement and a spray-on epoxy system. In-situ sealing of the existing stormwater conveyance system was performed utilizing both acrylamide grout injection and cured in place lining for the vitrified clay piping conveyance system. Prior to pipelining and sealing, the stormwater collection piping was cleaned in the same manner as the catch basin structures. Approximately 290 feet of piping was sealed utilizing a cured-in-place liner.

Visual observations/sampling of the stormwater catch basins CB-01 and CB-02 was conducted once per week for a period of one month after the majority of rehabilitation activities were completed (February 2013). Visual observations/sampling consisted of sampling the water in the structure (if possible) for odors, sheens and turbidity. If the structure was dry, olfactory and visual observation from above was conducted for odors and significant sheens, respectively. After one month of weekly visual/olfactory observations, the frequency was conducted on a monthly basis to ensure that no infiltration of petroleum was occurring. No evidence of petroleum was observed in CB-01. Between February and November 2013, no evidence of petroleum was observed in CB-02. In November 2013, several “weeps” of petroleum material was observed infiltrating into CB-02. In December 2013 and January 2014, Inland Waters sealed the “weep” areas with acrylamide grout and hydraulic cement.

Between January 2014 and September 2022 containment booms and snares were maintained in the catch basins to contain any petroleum sheen. Although some sheening has been observed in CB-02 (the source of this sheen is unknown), no sheening has been observed in downgradient structures (CB-01 and MH-01).

Additionally, as part of the existing NBC sewer connection permit for the Natural Gas Regulation Facility building, annual wet weather sampling was conducted in MH-01 between 2013 and 2021 when the permit requirement to conduct these observations was no longer required. No evidence of sheen or product has been observed.

4.3 NATURAL GAS LEAK REPAIR AREA

In January 2013, TNEC/GZA was notified of a natural gas leak in the western portion of the Site by TNEC’s gas operations personnel. The gas leak was detected proximate to an occupied building and was classified as an emergency by TNEC. The gas leak was traced to an 18” diameter ductile iron natural gas pipe leaking at approximately 12 feet bgs. Dewatering was necessary to repair the leaks in the piping. During repair operations, sheens were observed in the excavation intermittently. On January 29, 2013, the sheen was sampled by GZA and analyzed by New Fields Laboratory of Rockland, Massachusetts and was determined to be comprised primarily of “heavy middle distillate” (e.g., cutting oil, light lubricating oil, or gear oil), with low levels of pyrogenic poly-aromatic hydrocarbons (PAHs). The source of this sheen / product is unknown. The laboratory report from New Fields Laboratory is included in **Appendix O** (noted as February 26, 2013 New Fields Chemical Fingerprinting Summary Letter and Analytical Report).

Additional gas leaks / upgrades have been repaired by TNEC in this area in 2015, 2016 and 2017. Similar type sheens were observed when the excavation was left open overnight and quickly dissipated during dewatering activities.

4.4 HOLDER 18/21 CAPPING PROJECT STRAP

The Holder 18/21 Capping Project was performed to cap an area of the Site that had surface soil exceedances of the RIDEM I/C-DEC. The Holder 18/21 Capping Project was described in the April 2016 *STRAP – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC and May 2016 *STRAP Addendum – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC. The *STRAP* activities were approved by RIDEM with a May 18, 2016 *Short Term Response Action Approval Letter* issued to TNEC.

The majority of the Holder 18/21 Capping Project was completed in the Fall of 2016. The *Holder 18/21 Capping Project STRAP* activities included clearing and grubbing, installing erosion and sedimentation controls, miscellaneous demolition activities, select spot excavation, grading and off-Site disposal of excess materials, installation of an engineered cap (landscaped cap, asphalt, and crushed stone), and restoration activities (hydroseeding and fencing). The installation of the engineered cap included on-Site infiltration of treated stormwater via construction of a forebay and vegetated sand filter system.

Engineered caps were designed to mitigate direct exposure to underlying impacted soils across the approximate 201,537 SF (4.6 acres) *Holder 18/21 Capping Project STRAP* Area and limit further degradation of groundwater in certain areas with asphalt and/or liner caps. The following is a description of the engineered caps that were installed as part of this project:

- Asphalt Engineered Cap (approximately 119,745 SF – 2.75 acres): the engineered cap consisted of 2-inches of binder course asphalt overlain with 2-inches of top course.
- Asphalt Engineered Cap underlain with a geosynthetic liner system (approximately 21,960 SF – 0.5 acres): the engineered cap consisted of a geosynthetic liner system (textured linear low density polyethylene (LLDPE) with an 8-ounce non-woven geotextile cushion layer above and below), overlain by at least 8-inches of imported processed gravel and finished with asphalt (2-inches of binder course overlain with 2-inches of top course).
- Topsoil Engineered Cap underlain with a geosynthetic liner system (approximately 6,381 SF – 0.15 acres): the engineered cap consisted of a geosynthetic liner system (textured LLDPE with an 8-ounce non-woven geotextile cushion layer above and below), overlain by at least 6-inches of imported granular fill and finished with at least 6-inches of imported topsoil. Hydroseeding of this cap was performed as part of Site restoration.
- Riprap Engineered Cap (approximately 11,296 SF – 0.26 acres): the engineered cap consisted of an 8-ounce non-woven geotextile overlain by at least 12-inches of imported Rhode Island Department of Transportation (RIDOT) R-3 Riprap.
- Topsoil Engineered Cap (approximately 20,822 SF – 0.48 acres): the engineered cap consisted of an 8-ounce non-woven geotextile overlain by overlain by at least 6-inches of imported granular fill and finished with at least 6-inches of imported topsoil. Hydroseeding of this cap was performed as part of Site restoration.
- 2-inch Crushed Stone Engineered Cap (approximately 21,333 SF – 0.49 acres): the engineered cap consisted of an 8-ounce non-woven geotextile overlain by at least 6-inches of imported granular fill and finished with at least 6-inches of imported 2-inch crushed stone.

During the Holder 18/21 remedial activities, a total of approximately 801.85 tons of excess soil was excavated, transported and recycled at ESMI in Loudon, NH for thermal desorption.

The Holder 18/21 Capping Project was documented in the April 2017 *Short Term Response Action Completion Report – Holder 18/21 Capping Project* prepared by GZA on behalf of TNEC. This report was submitted to RIDEM on April 28, 2017.

4.5 DIKE WALL ACCESS ROAD PROJECT STRAP

The Dike Wall Access Road Capping Project was proposed to cap an area for a new access road for the LNG portion of the Site. The Dike Wall Access Road Capping Project was described in the June 2016 *STRAP – Dike Access Road* prepared by GZA on behalf of TNEC and the August 2016 *STRAP Addendum – Dike Access Road* prepared by GZA on behalf of TNEC. The *STRAP* activities were approved by RIDEM with the August 25, 2016, *Short Term Response Action Approval Letter* issued to TNEC. The Dike Wall Access Road Capping Project was completed in January 2020.

The Dike Wall Access Road Capping Project activities include installing erosion and sedimentation controls, grading and off-Site disposal of excess materials and installation of an engineered cap. The construction of the engineered cap included on-Site infiltration of treated stormwater via the construction of an engineered underground treatment/infiltration unit.

Engineered caps were designed to mitigate direct exposure to underlying impacted soils across the approximately 39,000 SF (0.90 acres) Dike Wall Access Road Capping Project area.

As part of the Dike Wall Access Road Capping Project, a total of approximately 3,232 tons of soil of excess soil was excavated, transported and disposed of at ESMI in Loudon, NH for thermal desorption.

4.6 LIQUEFACTION PROJECT STRAP

The Liquefaction Project STRAP was prepared to establish soil and groundwater management procedures associated with ground disturbance activities for the Proposed Liquefaction Plant in the LNG portion of the Site. The Project was described in the May 2017 *STRAP – Proposed Liquefaction Project* prepared by GZA on behalf of TNEC. GZA also prepared and submitted a STRAP Addendum for the project in October 2017. Figure 7 depicts the areas of the Site where these remedial activities have been completed or are ongoing and Figure 8 presents the location of RIDEM-approved engineered caps and controls that have been installed.

The Liquefaction Project STRAP activities include limited clearing and grubbing, installing erosion and sedimentation controls, testing of and import of clean fill materials, grading and off-Site disposal/recycling of excess materials, management of excess soil and groundwater during earthwork activities for pile installations and utility installations (water, drainage, natural gas and both overhead and underground electric), installation of engineered caps and restoration activities (fencing and gate installation). All areas of soil and groundwater disturbance will be capped as described herein to mitigate direct exposure to underlying impacted soils consistent with RIDEM requirements. The installation of engineered caps includes stormwater management via a forebay and lined sand filter with discharge of stormwater to the Providence River.

Engineered caps were designed to mitigate direct exposure to underlying impacted soils across the approximately 150,317 SF (3.45 acres) Liquefaction Project STRAP area. The following is a description of the engineered caps that are proposed to be installed:

- Asphalt Engineered Cap (approximately 41,088 SF – 0.94 acres): the engineered cap will consist of at least 4-inches of asphalt underlain by at least 6-inches of processed gravel, sand or other clean imported granular fill;
- Riprap Engineered Cap (approximately 5,351 SF – 0.12 acres): the engineered cap will consist of a non-woven geotextile overlain by at least 12-inches of imported Riprap;
- Concrete Engineered Cap (approximately 27,275 SF – 0.63 acres): the engineered cap will consist of a competent concrete surface consisting of at least 4-inches of concrete underlain by at least 6-inches of clean imported granular fill;
- Crushed Stone Engineered Cap (approximately 73,333 SF – 1.68 acres): the engineered cap will consist of at least 18-inches of imported granular fill and finished with 6-inches of imported 2-inch crushed stone; and
- Sand Filter (approximately 3,270 SF – 0.08 acres): the sand filter will consist of a LLDPE liner system, overlain by at least 12-inches of $\frac{3}{8}$ " pea stone, overlain by a geotextile and finished with at least 18-inches of clean imported C-33 sand. As noted above, no infiltration is proposed under this STRAP.

As part of the Liquefaction Project STRAP activities, excess soil was transported and recycled at ESMI in Loudon, NH for thermal desorption. The STRAP for this project was approved by RIDEM on October 27, 2017 and construction began in

December 2018. STRAP activities were completed in 2022, GZA submitted a STRAP Completion report for the Liquefaction Project on March 21, 2023.

4.7 SEAWALL

TNEC has completed construction of a new seawall/bulkhead along the shoreline of the Site. This work was performed in accordance with the 2012 SMP, and was restored with an engineered cap. Figure 7 depicts the areas of the Site where these remedial activities are complete, and Figure 8 presents the location of RIDEM-approved engineered caps and controls that have been installed for the Seawall Project. The soil and groundwater management as well as restoration activities for the seawall project will be summarized in an Annual SMP compliance report going forward.

4.8 PROPOSED LNG MODERNIZATION PROJECTS

National Grid LNG is currently planning several projects within their leased portion of the Site to maintain the LNG operations for the future. These projects include replacing the existing vaporizers and associated building, replacing the boil off gas compressors and associated building, building a new control room and administrative building, constructing a new storage building, updating the electrical supply by installing a new power distribution center, making improvements to the flood mitigation measures to protect critical infrastructure, and installing stormwater management systems to treat runoff from new impervious areas. For each of these projects the project area will be progressively capped in accordance with RAA#2, described below. These projects are currently in the design phase with construction expected to begin in 2025 and will take several years to complete. The earthwork associated with these projects will be performed in accordance with the 2012 SMP.

4.9 CURRENT ENGINEERED CONTROLS AT THE SITE

Approximately 74% (30.3 acres of a total 41 acres) of the Site has been remediated via a combination of impacted soil removal and installation of RIDEM approved engineered caps Figure 8 was prepared to present the current status of engineered controls at the Site.

Engineered caps that have been installed at the Site consist of the following:

- At least 24-inches (2 feet) of clean soil or stone material²⁴ (7.24 acres);
- At least 12-inches (1 foot) of clean soil or stone material underlain with a non-woven geotextile barrier (4.26 acres);
- Building footprint (1.98 acres);
- Concrete surface (1.33 acres);
- Asphalt surface (14.82 acres); and
- LLDPE liner system overlain with clean fill or asphalt (0.65 acres).

Additionally, while there are portions of the existing LNG facility that are not currently capped with a RIDEM-approved engineered cap, the entirety of the LNG facility (16.36 acres) is surrounded by a double layer of chain link fencing with razor wire which is inspected on a daily basis. Access to this portion of the Site is limited to trained, on-Site personnel. Ground cover within this portion of the LNG facility consists of a layer of crushed stone; no surface soils are exposed. The combined security fencing and crushed stone associated with the LNG facility are considered to constitute an effective alternative

²⁴ Soil at least meeting Remedial Objectives as defined in Section 1.9.2 of the Remediation Regulations and/or RIDEM Residential Direct Exposure Criteria (R-DEC).

engineered control. The total area that is effectively controlled via engineered caps and the LNG security fencing is approximately 33.5 acres or 82% of the Site.

5.0 NATURE AND EXTENT OF OBSERVED IMPACTS

This section presents observations made and the results of soil and groundwater analytical testing performed during the 2014-2016 supplemental Site investigations combined with historical Site investigation results performed between 1994 and 2014, as well as the results of groundwater monitoring from 2016 to 2022. These results are subdivided into the five categories in the following subsections: surface soils, subsurface soils, NAPL observations and groundwater.

This section presents GZA's interpretation of the data in terms of the nature and extent of impact, including the distribution of Method 1 Regulatory exceedances. This regulatory exceedance comparison considered the current environmental setting and use of the property, as well as foreseeable future use of the property. Accordingly, the data were compared to the RIDEM Method 1 GB Groundwater Objectives, the GB-Leachability Criteria, the I/C-DEC and UCLs. This approach is consistent with a proposed remedy that includes the establishment of an ELUR for the Site. In the event of future Site development (utility work or projects), assuming the use of the property and remedial approach does not change, the ELURs would apply, and any material handling would be performed consistent with a RIDEM-approved SMP.

The text presented below provides relative comparisons to the applicable soil and groundwater criteria. For a comprehensive summary of quantitative analytical testing results, please refer to historical Site investigation reports (summarized in **Appendix E**), as well as the 2014-2017 and 2018 through 2022 groundwater monitoring reports submitted to RIDEM.

5.1 FIELD SCREENING AND OBSERVATIONS OF IMPACTED SOILS

Explorations performed at the Site indicate the presence of up to approximately 20 feet of urban fill underlain by organic silt (non-continuous across the Site), outwash deposits and glacial till. The fill consists of sands and gravels with concrete, coal, asphalt, brick fragments, cinders, and cinder ash. Visual and olfactory indicators of impacts (i.e., petroleum-like and/or coal tar-like) were noted in the majority of the explorations generally increasing to the water table and decreasing with depth below the water table. Generally, TVOC readings were most significant coincident with the water table and decreased with depth. Visual and olfactory indicators of impacts were generally noted in areas of historical operations and historical (19th century) filling at the Site. Visual and olfactory indicators of impacts were generally detected closer to the water table (4 to 13 feet bgs); however, some areas of deeper impacts were noted in the central portion of the Site proximate to historical operations.

5.2 SURFACE SOILS (THAT ARE NOT ADDRESSED BY AN EFFECTIVE ENGINEERED CONTROL)

In general, results of the analytical testing for surface soils (i.e. upper 2 feet of the soil column) within the non-capped portions of the Site indicate widespread exceedances of the I/C-DEC for arsenic, lead and/or PAHs (primarily Benzo [a] Pyrene, Benzo [b] Fluoranthene and Benzo [a] Anthracene).²⁵ Prior to recent remedial actions completed under STRAPs for the Site, visual evidence of fill was noted for the vast majority of surface soils on the Site. In general, these compounds and concentrations detected are indicative of urban fill, which is very common for industrial properties in urban areas.

The primary exposure pathways of concern are direct contact with impacted soils. The majority of the Site is surrounded with a locked perimeter fence. Recent remedial actions further limit direct contact with Site soils due to the installed engineered caps.

²⁵ As noted above, approximately 30.3 acres of the Site have been improved with an engineered cap and the entirety of the LNG facility are considered to be controlled with engineered controls (crushed stone at surface and fencing). Therefore, this section intends to only present surface soil impacts that are noted to be located in areas that are not currently controlled with engineered controls.

5.3 SUBSURFACE SOILS

Subsurface soils (those located greater than 2 feet bgs) are characterized by similar impacts as surface soils (i.e., arsenic, lead and PAHs above RIDEM Method 1 criteria), but generally at higher concentrations and at a higher frequency of detections. In addition, exceedances of TPH and VOCs (GB Leachability) were also detected in subsurface soils in higher frequency than in surface soils. Inorganics (arsenic, lead, cyanide, and other inorganics) were not detected as frequently in subsurface samples when compared to surface soil detections. Similar to surface soil results, PAHs and arsenic were prevalent throughout the Site and VOCs, while TPH and lead exceedances, however, tend to be more localized. Several samples were submitted for TPH fingerprinting throughout the Site at varying depths. Results indicated a combination of fuel oils and tar impacted hydrocarbons in isolated pockets of the Site, with more fuel oil -like impacts detected at and above the water table, while more coal tar -like impacts detected below the water table.

Results of the analytical testing for the subsurface soils located at the Site indicate the presence of PAHs, TPH, and VOCs above the I/C-DEC and GB Leachability Criteria (TPH and VOCs only). The inorganic impacts exceeding the I/C-DEC were limited to arsenic and lead. UCL exceedances were limited to TPH and naphthalene only.

As expected, the extent of exceedances of applicable RIDEM criteria and TPH fingerprinting results in subsurface soils is generally concentrated in areas where historical MGP features and operations were located and also coincident with the depths of staining and other observations of impacts. The majority of exceedances occurred less than ten (10) feet bgs above the water table, with less impacts observed below the water table.

Many of the previously completed remedial actions that have been conducted for the Site (as described above in **Appendix AA** and **Appendix F**) focused on source removal in areas of historical MGP features. As such, the majority of remaining limited UCL exceedances remain in areas of the Site where excavation and source removal would be very difficult (depth, critically important infrastructure, utility corridors and security Site features).

The primary exposure pathway of concern for subsurface soils is direct contact to impacted soils during potential future construction/utility work.

5.4 NAPL OBSERVATIONS

LNAPL has been detected at thicknesses of between trace amounts to up to 3.58 feet at the Site in seventeen (17) monitoring wells (out of a total of seventy-five (75) monitoring wells) between 2011 and 2022 (RCA-21, RCA-29, RCA-40, VHB-3, VHB-10, VHB-21, VHB-22, VHB-23, GZ-307S, CHES RW-2, CHES RW-3, CHES RW-4, CHES RW-5, ESS RW-1, ESS RW-2, RW-1 and GZ-501S). LNAPL has been detected primarily in areas of historical MGP features and operations (RCA-21, RCA-29, RCA-40, VHB-10, VHB-21, VHB-22, VHB-23, CHES RW-2, CHES RW-3, CHES RW-4, CHES RW-5, ESS RW-1, ESS RW-2 and RW-1), however, some limited LNAPL thicknesses has been detected along the northern property line (VHB-3 and GZ-307S). The greatest thickness of LNAPL were detected in RCA-21 (0.91 to 3.58 feet). RCA-21 was replaced with RW-1 in 2014 and the thickness has decreased between 2014 and 2016 to between trace and 0.02 feet. The vast majority of detections of LNAPL detections at the Site have been between trace and 0.10 feet in thickness.

DNAPL has only been observed in trace amounts at the Site in RCA-3, along the northern property line, cross-gradient of Former MGP operations.

LNAPL detections are located in various areas of the Site (i.e., proximate to the cove near historical MGP operations, proximate to an active drain line along the northern property line and proximate the current day LNG containment dike near historical MGP operations) are likely the result of multiple source areas and are not observed in monitoring wells consistently across the Site areas. In the event a contiguous layer of LNAPL existed, the distribution pattern would tend to be more consistent and defined. The LNAPL distribution pattern observed at this Site suggests individual, localized “pockets” of LNAPL with limited potential for migration. While some evidence of sheen outbreaks ranging from spots to bands have been observed in the cove

portion of the Providence River adjacent to the areas of the Site where upland LNAPL impacts have been noted, significant remedial work was completed in these upland areas which included removal of MGP materials from former structures, cleaning of the structures, backfilling with clean soil and restoration of the area with an effective engineered caps and engineered controls. Based on the lack of significant thicknesses of LNAPL along the cove area and previous remedial work completed in this area, it is likely these sheen observations are the result of limited residual impacts.

Although NAPL observations are considered to be a UCL exceedance per Section 1.9.3 of the Remediation Regulations and given the limited current observation of NAPL across the Site and the isolated nature of such observations, no specific remedy to address NAPL is warranted. This condition will be addressed via natural attenuation and regular monitoring. Observation of the shoreline and maintaining the boom system in the cove will be continued along with monitoring well gauging for NAPL as part of the Site's routine monitoring.

5.5 GROUNDWATER RESULTS

The most significant groundwater impacts (in terms of dissolved phase constituents) were observed in areas at the Site generally coincident with areas proximate to Former MGP operations, observed NAPLs and subsurface soil impacts (RCA-1, RCA-12R, RCA-22, RCA-28, RCA-36, VHB-7, VHB-10, VHB-21, GZ-314S/D and GZ-315D). In these locations, benzene, ethylbenzene, toluene, and naphthalene were consistently present at concentrations above the GB Groundwater Objective. No exceedances²⁶ have been observed in large areas of the Site, including the northern and eastern portions of the Site along the Providence River and the southeastern portion of the Site proximate to the area occupied by Holcim.

While these dissolved phase constituents are likely migrating with the groundwater toward the Providence River (an impaired waterway), the Site is not located within 1 mile of a wellhead protection area. The Site is located at least 1.8 miles from an area with a GA groundwater use designation. Given the observed groundwater flow and regional groundwater flow direction (towards the Providence River), as well as the locations of the nearest public drinking water supplies and wellhead protection area, groundwater impacts from the Site are not expected to affect local drinking water resource areas. In addition, groundwater at the Site is not expected to be classified as a potential future source of drinking water. As such, exposure to impacted groundwater via on-Site drinking water supplies is not expected to be a concern at the Site.

6.0 **CONCEPTUAL SITE MODEL**

This section provides a description of the Conceptual Site Model (CSM) that guided GZA's remedial evaluation of the Site. This description of the CSM outlines:

- potential sources of impact; and
- potential exposure pathways.

The CSM, which evolved as the work was completed, was used to select the number, type, and location of environmental samples and to establish a framework for evaluating the adequacy of Site investigations performed to date.

6.1 POTENTIAL SOURCES OF IMPACTS

Between approximately 1910 and 1954, a MGP was in operation at the Site. The MGP operations were discontinued in approximately 1954 and, as is typical of the documentation from this era, it is unclear to what extent below grade components of the MGP were demolished/removed. Coal tar was a primary residual of the coal gas, carbureted water gas and producer

²⁶ Although it was detected in excess of RIDEM GB Groundwater Objectives in several monitoring wells, vinyl chloride is not expected to be a constituent of concern associated with the Site. The detection of Vinyl Chloride at the Site is expected to be from off-Site impacts.

gas processes, which were reportedly performed at this plant. Coal tar can be either lighter or denser than water (typically denser), relatively immobile and persistent under geologic and hydrogeologic conditions. It is generally composed of a complex mixture of PAHs that exhibit low volatility, low solubility, low biodegradability, and high adsorption tendency.

Lighter oils, raw condensate and purifying waters represent other typical MGP residual streams. The oils typically contain monocyclic and duo cyclic aromatic hydrocarbons including benzene, toluene, ethylbenzene, and xylenes. These aromatic hydrocarbons generally exhibit moderate solubility and biodegradability and are generally volatile and have low adsorption tendencies. The purifying process often generated filtration mediums, containing the filtered gas impurities such as cyanide, metals, sulfur, ammonias, phenols, and tars. Some plants sold oil, tar, and/or ammonia by-products for other uses depending upon local market demands and the ability of the plants to effectively separate materials.

Subsequent to the MGP operations, from approximately the 1950s to present day the use of the Site has been a bulk product storage facility (LNG, propane, and cement), LPG and propane gas production, natural gas regulation facility and fuel storage and distribution. These operations were located within the footprint of the Former MGP operations and within areas formerly filled. Surficial and below grade releases of petroleum products are viewed as potential sources of contamination at the Site.

Given the widespread placement of urban fill at the Site during the late-1800s and early-1900s, the persistence of MGP residuals in the environment, and the extensive location and duration of operations at the Site, the detected constituents located above and at the groundwater table appear to predominantly be a result of comingling of impacts from both the MGP operations and upgradient fuel storage and use. These commingled impacts are generally highest proximate to the groundwater table and decrease with depth.

6.2 POTENTIAL EXPOSURE PATHWAYS

The primary potential exposure pathways identified for the Site, based on current and foreseeable future use, are as follows:

- Direct contact with near surface impacted soils that remain uncapped or not addressed by effective engineered controls;
- Direct contact with subsurface soils by future construction/utility workers; and
- Presence of limited areas of NAPL.

The following sections further describe the potential exposure pathways identified above. As described in Section 7.00, the primary goal of the selected remedial alternative is to adequately address these exposure pathways.

6.2.1 Direct Contact with Surface Soils

Widespread inorganic and PAH surface soil impacts were detected across the Site in uncapped surface soils at concentrations exceeding the I/C-DEC.

For surface soil, the primary potential exposure pathways of concern at the Site are direct contact.

As noted previously, approximately 74% (30.3 acres of a total 41 acres) of the Site of the Site has been remediated via a combination of impacted soil removal and installation of RIDEM approved engineered caps.

Additionally, while there are portions of the existing LNG facility that are not currently capped with a RIDEM-approved engineered cap, the entirety of the LNG facility (16.36 acres) is surrounded by a double layer of chain link fencing with razor wire which is inspected on a daily basis. Access to this portion of the Site is limited to trained, on-Site personnel. Ground cover within this portion of the LNG facility consists of a layer of crushed stone; no surface soils are exposed. The combined security fencing and crushed stone associated with the LNG facility are considered to constitute an effective alternative engineered control.

In addition, the majority of the remainder of the Site is fenced and restricted to prevent unauthorized access. Therefore, under current Site conditions, the concern related to direct exposure is generally mitigated by the presence of a security fence which restricts access to RI Energy personnel and authorized visitors.

6.2.2 Direct Contact with Subsurface Soils

Figure 8 was prepared to present the current status of engineered caps and controls at the Site. Similar to surface soil, widespread subsurface soil impacts were detected throughout the Site at concentrations exceeding the Method 1 I/C-DEC and exceeding the GB Leachability Criteria. In addition, the most elevated subsurface impacts were observed proximate to the Former MGP operations (central portion of the Site – proximate to the Former Compressor House No. 1 and the central portion of the present-day LNG Facility).

For subsurface soils, the primary exposure pathway of concern is direct contact to impacted soils during potential future construction/utility work. While under existing Site conditions direct exposure to these impacts is not a concern given their depth (greater than 2 feet below grade), a potential exists for exposure to these impacted materials during on-Site construction and future Site redevelopment.

6.2.3 Presence of Limited Areas of LNAPL

Measurable LNAPL is currently (between 2015 and 2022) observed in certain limited areas of the Site at thicknesses ranging from trace amounts to 0.33 feet, with no LNAPL detected in the vast majority of wells. These LNAPL are likely the result of multiple source areas and are not observed in monitoring wells consistently across the Site areas. In the event a contiguous layer of LNAPL existed, the distribution pattern would tend to be more consistent and defined. The LNAPL distribution pattern suggests individual, localized “pockets” of LNAPL. Given the limited nature of these LNAPL observations, they will continue to be addressed via natural attenuation and monitoring.

7.0 REMEDIAL OBJECTIVES

As discussed above, previous remedial actions and Site development work, including those performed more recently by TNEC (i.e., *Holder 18/21 Capping Project STRAP*) and NG LNG, LLC (i.e., *Liquefaction STRAP*), have effectively addressed potential human health risks by mitigating potential exposure pathways associated with direct contact in approximately 29.44 of 41 acres of the total Site. Figure 8 presents the limits and types of RIDEM-approved engineered caps and controls currently in place. Based on the information presented in this figure, it is estimated that approximately 11.58 acres (28%) of the Site remains to be capped as part of future remedial work at the property.

In addition, certain of these remedial measures (i.e., Former MGP structure remediation and source removal) substantially addressed potential impacts to environmentally sensitive areas and natural resources by mitigating potential migration of MGP residuals to the cove area and Providence River.

Consistent with the Remediation Regulations, the overall remedial objective is to provide protection of human health and the environment relative to the identified constituents of concern in soil and groundwater. In the preparation of the overall Site remediation evaluation, it is assumed that the placement of the existing engineered controls at the Site have effectively addressed identified human health risks by mitigating potential exposure pathways associated with direct contact. An ELUR preventing potable use of groundwater and residential use of the Site, as well as maintaining the integrity of the existing engineered controls and providing restrictions related to the disturbance of impacted materials below the existing engineered caps (in the form of the SMP), will be an integral part of the remedial approach.

The following specific remedial objectives were identified for this Site based on the nature and extent of the observed impacts and our CSM (presented above in Section 6.0):

- Prevention of direct contact to surface soils exhibiting concentrations above the Method 1 I/C-DEC that are not currently controlled with engineered caps and controls (approximately 11.58 acres); and
- Prevention of direct contact with impacted subsurface soils with concentrations above the Method 1 I/C-DEC by future construction/utility workers.
- Continued natural attenuation and monitoring of LNAPL.

Since there is no identified use or current exposure risk, these remedial objectives do not directly address dissolved phase groundwater impacts. Groundwater quality will be monitored and is expected to continue to improve via natural attenuation.

The remedial alternatives identified below in Section 8.0 were evaluated based on several criteria, including their ability to achieve these objectives. As indicated, in performing the remedial alternative evaluation, we assumed that an ELUR preventing use of groundwater and restricting use of the Site to commercial or industrial use will be an integral part of the selected remedy. This ELUR will also be implemented to maintain existing engineered controls and restrictions related to the disturbance of impacted materials. In addition, the ELUR would include the existing SMP to address handling of impacted soil and groundwater which may be encountered during future construction projects or other Site activities.

Section 8.0 presents an evaluation of identified remedial alternatives for the Site and Section 7.0 presents the selected remedial alternative along with the rationale for its selection. Section 11.0 describes a preliminary implementation schedule.

8.0 REMEDIAL ACTION ALTERNATIVES

Three Remedial Action Alternatives (RAAs) for the Site have been identified:

- RAA#1: No Action with Monitored Natural Attenuation (MNA) and ELUR;
- RAA#2: Progressive Engineered Capping, ELUR, Monitored Natural Attenuation, Groundwater Monitoring, Fencing Maintenance and Boom Maintenance; and
- RAA#3: Significant Source Removal, Engineered Capping, ELUR, Monitored Natural Attenuation, Fencing Maintenance and Groundwater Monitoring.

Each of these alternatives is described below.

8.1 REMEDIAL ACTION ALTERNATIVE #1: NO ACTION WITH MONITORED NATURAL ATTENUATION (MNA) AND ELUR

Under this alternative, no further actions would be taken to address identified soil impacts and natural attenuation mechanisms would be relied upon to address groundwater/NAPL impacts. Natural attenuation monitoring would be performed initially semi-annually and over the longer term on an annual basis and would consist of gauging the Site monitoring well network for the presence of NAPL, performing NAPL recovery and collecting and analyzing groundwater samples from select monitoring wells. An ELUR would be implemented for continued restricted industrial use of the Site and restrictions on groundwater use at the Site (not for potable use), as well as maintenance of the existing engineered caps. The ELUR would include the SMP to address handling of impacted soils and groundwater during future construction projects. The SMP includes procedures for soil screening/disposal requirements, soil stockpile management and erosion controls, odor controls, dust controls, capping requirements, decontamination protocols for equipment leaving the Site, requirements for import of soils, basic dewatering

guidelines and management of non-soils (such as asphalt or concrete). This alternative would not include implementation of any additional engineered controls to address the uncontrolled portions of the Site. Routine annual inspections, maintenance and repair of the controls (existing) as necessary are also included as part of this RAA#1 to ensure compliance.

This alternative could be implemented immediately, is considered to be the least permanent and is anticipated to be the lowest cost approach.

8.2 REMEDIAL ACTION ALTERNATIVE #2: PROGRESSIVE ENGINEERED CAPPING, ELUR, MNA, GROUNDWATER MONITORING, FENCING MAINTENANCE AND BOOM MAINTENANCE

Remedial Action Alternative #2 (RAA#2) involves the progressive construction of new and maintenance of existing engineered controls across the Site designed to mitigate direct exposure risks to impacted surficial Site soils. These caps and controls would be installed on a progressive basis as redevelopment of the Site is planned and construction projects are implemented. Consistent with RIDEM requirements, the caps would likely consist of at least 2-feet of clean imported fill, 1-foot of clean imported fill underlain with geotextile, asphalt underlain by at least 6-inches of clean imported fill or at least four-inches of concrete. Engineered controls such as fencing, stockpile covering, water application for dust control and others would be instituted during construction to mitigate potential dust, vapor and odor migration during remedial implementation (capping and controls installation). Routine annual inspections, maintenance and repair of the caps (existing and progressively installed) and fencing as necessary are also included as part of this RAA#2 to ensure compliance. The boom within the cove area would also be regularly inspected on a monthly basis and maintained as needed as part of this RAA#2.

Similar to RAA #1, this alternative relies on natural attenuation mechanisms to address remaining dissolved phase groundwater impacts and NAPL. Natural attenuation groundwater monitoring, as described under RAA#1 would be performed initially semi-annually and over the longer term annually to track and evaluate the reduction in constituents of concern mass.

Similar to RAA#1, an ELUR would be implemented for continued restricted industrial use of the Site and restrictions on groundwater use at the Site (not for potable use). In addition, the ELUR would include maintenance of the existing engineered caps and requirements to be followed related to the disturbance of impacted materials beneath the existing and future engineered caps. The ELUR would also include the SMP, which would include handling of impacted soils and groundwater during potential future construction projects. The SMP includes procedures for soil screening/disposal requirements, soil stockpile management and erosion controls, odor controls, dust controls, capping requirements, decontamination protocols equipment leaving the Site, requirements for import of soils, basic dewatering guidelines and management of non-soils (such as asphalt or concrete). The ELUR would also include provisions for notification to RIDEM of future construction projects at the Site.

As previously noted, approximately 74% (30.3 acres of a total 41 acres) of the Site of the Site has been remediated via a combination of impacted soil removal and installation of RIDEM approved engineered caps. Additionally, while there are portions of the existing LNG facility that are not currently capped with a RIDEM-approved engineered cap, the entirety of the LNG facility (16.36 acres) is surrounded by a double layer of chain link fencing with razor wire which is inspected on a daily basis and the majority of the remainder of the Site is currently fenced to restrict access.

This RAA#2 assumes that an engineered caps and controls would be progressively implemented across the remaining portion of the Site, as facility construction projects are completed. The area which will be subject to future progressive capping is shown on Figure 8 (*Recommended Remedial Alternative*).

Under this RAA#2, the perimeter Site fencing would also be maintained to limit trespassing and direct access to the Site.

Under this RAA#2, the existing boom in the cove would also be inspected and maintained.

This alternative is considered highly effective and reliable at mitigating short- and long-term exposure risks related to direct exposure to impacted surface soils when compared to RAA#1. This alternative is considered to be more permanent than

RAA#1, while being marginally less permanent than RAA#3. This alternative utilizes standard construction techniques so this alternative would also be considered readily implementable to address the direct exposures issues. Implementation of this alternative would effectively address potential construction worker risks associated with impacted subsurface soils via adherence to the SMP procedures as described above. This alternative would also include continued inspection and maintenance of the boom, NAPL gauging and routine groundwater monitoring and cap inspections.

Costs associated with this RAA#2 would be higher than RAA#1, but less than RAA#3.

8.3 REMEDIAL ACTION ALTERNATIVE #3: SIGNIFICANT SOURCE REMOVAL, ENGINEERED CAPPING, ELUR, MNA, FENCING MAINTENANCE AND GROUNDWATER MONITORING

RAA#3 includes extensive excavation of observed source area impacts associated with historical operations across the Site (estimated at approximately 65,000 CY (assume soil excavation over approximately 5 acres to a depth of approximately 8 feet) of impacted soil removed and disposed off-Site). Removal efforts would involve excavation of impacted areas to the depth of observed significant visual impacts (*i.e.*, visual indicators of “coated, blebs, saturated and/or free product”). In addition, source removal efforts would necessitate removal and excavation under the containment dike which serves as secondary containment to the existing LNG tank. Implementation will also likely require NAPL and groundwater management, including groundwater treatment and discharge. Based on Site experience, dewatering efforts would likely be significant given the proximity to the river and groundwater recharge rates encountered during previous construction projects at the Site (on the order of 100,000 gallons per day). The disturbance of the containment dike would require significant outages of critical infrastructure systems during construction.

Significant dust, vapor and odor control and monitoring would be required during remedial implementation.

Under this RAA#3, the perimeter Site fencing would also be maintained to limit trespassing and direct access to the Site.

Similar to RAAs #1 and #2, this alternative relies on natural attenuations mechanisms to address remaining dissolved phase groundwater impacts and NAPLs. Natural attenuation groundwater monitoring, as described under RAA#1 and RAA #2 would be performed initially semi-annually and over the longer term annually to track and evaluate the reduction in constituents of concern mass.

Similar to RAAs #1 and #2, an ELUR would be implemented for continued restricted industrial use of the Site and restrictions on groundwater use at the Site (not for potable use). In addition, the ELUR would include maintenance of the engineered caps and restrictions related to the disturbance of impacted materials beneath the engineered control caps. The ELUR would include the SMP (as described above in RAA#2) to address handling of impacted soils and groundwater during potential future construction projects.

This alternative is considered highly effective, permanent, and reliable at mitigating long term exposure risks related to direct exposure to Site constituents when compared to RAA#1, and marginally more effective, permanent and reliable than RAA#2. Effectiveness, permanency, and reliability of excavation as a remedial alternative, however, generally relies on ease of excavation, depth of the water table and logistical considerations associated with the accessibility of source material, complexity of subsurface debris and presence of significant subsurface utility networks. Given the nature of the historical fill at the Site, the history of industrial use at the Site, and limitations associated with the facility (existing facility, critically important infrastructure, utility corridors and security Site features), excavation would be difficult and cost prohibitive. As previously discussed, areas of TPH impacts beneath the containment dike would not be accessible under this RAA. The shallow water table would also require dewatering, treatment and discharge. Due to the handling of large volumes of contaminated soil over extensive areas, RAA#3 is expected to have significantly higher short-term implementation risks associated with potential odor, vapor and dust migration both on and off-Site. In addition, due to the quantity of contaminated soil, this alternative would require extensive management, on-Site stockpiling and subsequent loading and off-Site transportation, thus posing potential higher short-term risks (greatly increase in truck traffic in the area). Given the implementation limitations, excavation would likely not be able to

reduce soil concentrations to below RIDEM GB Leachability and I/C-DEC, would carry high costs for implementation (i.e., earth support systems, dewatering, transportation and disposal costs) and would likely still require engineering capping to control exposure risks. It is GZA's opinion, therefore, that RAA#3 provides only marginal environmental benefit compared to RAA#2, but with significantly more implementation risk and higher costs.

9.0 RECOMMENDED REMEDIAL ACTION ALTERNATIVE

Based on Site conditions and a review of the above outlined Remedial Alternatives, it is GZA's opinion that RAA #2 *Progressive Engineered Capping, ELUR, MNA, Groundwater Monitoring, Fencing Maintenance and Boom Maintenance*, is the appropriate approach for remediating the Site. This recommendation is based on consideration of the following:

- Current Site use is industrial/commercial and will remain such;
- Groundwater at the Site is classified GB, and is not used for human consumption, irrigation or processing; and
- Soil, groundwater and NAPL impacts at the Site are widespread and do not appear to be mobile;
- Reducing the risk of interruptions to critical utility infrastructure services; and
- To date, approximately 72% of the Site is currently complete with engineered caps to control direct exposure.

RAA #3 is expected to add little to no added benefit to the Site remedy and is considered to have high implementation costs and logistical complications pertaining to maintaining service of critical utility infrastructure. As previously mentioned, the nature of the fill at the Site indicates heterogenous material with many underground obstructions and unknown utilities/conditions, which would complicate the process of excavation. The effectiveness and reliability of RAA #3 is limited by the presence of heterogeneous fill (indicated by building remnants and obstructions), accessibility of the source material beneath existing facility features (i.e., UCLs beneath containment dike) and the complexity of the utility network at the Site. Furthermore, implementation of RAA #3 would potentially result in mobilization of impacts towards the Providence River, potentially increase dust and vapor production during excavation activities, and cause significant disruption of critical utility infrastructure services.

RAA#2 is effective in providing a remedy for the Site, especially as compared to RAA#3. RAA #2 is readily implementable, financially feasible, and brings the Site into compliance with the RIDEM Remediation Regulations. Since the completion of several major projects at the Site, approximately 72% of the Site has been remediated through progressive implementation of engineered caps, and approximately 82% of the Site is controlled via engineered caps and the LNG security fence as an alternative barrier. Furthermore, given the above implementation concerns and limitations associated with RAA#3, this alternative provides little to no added benefit compared to RAA#2, which has already addressed the majority of direct exposure risks to date at the Site. Therefore, it is GZA's opinion that continued progressive engineered capping (RAA#2) is the most appropriate remedial action for the Site.

10.0 PROPOSED GROUNDWATER MONITORING

The proposed groundwater monitoring program will consist of a semi-annual full gauging round and NAPL recovery (if detected) of the remaining monitoring wells and annual groundwater sampling of select monitoring wells. Twenty seven (27) monitoring wells are proposed to be sampled on an annual basis to provide adequate aerial coverage based on a review of historical data: RCA-1, RCA-12R, RCA-15, RCA-22, RCA-31, RCA-36, VHB-1, VHB-20, GZ-201, GZ-202, GZ-301D, GZ-304D, GZ-309D, GZ-319D, GZ-

500S, GZ 500D, GZ-501S, GZ-502S, GZ-311DR, GZ-313DR, GZ-315DR, GZ-318DR, RCA-3R, RCA-5R, VHB-3R, VHB-21R, and VHB-22R . Figure Y-1 (*Groundwater Monitoring Plan*) in **Appendix Y** presents the proposed groundwater monitoring program.

Prior to sampling, the following parameters will be assessed at each well: depth to groundwater, depth to well bottom, and depth to NAPL, if present. Groundwater samples will be collected from the wells containing NAPL. In order to limit the potential for LNAPL to enter the sampling tubing during the collection of the sample, a peristaltic pump will be used to force air through the tubing as it passed through the LNAPL/groundwater interface. In addition, if DNAPL were noted in the well, the sampling tubing was installed in these wells carefully so that the DNAPL layer was not intercepted or disturbed.

Groundwater sampling will be performed in accordance with the US EPA’s September 19, 2017 Low Stress (low flow) Purging and Sampling Procedure. As part of this sampling methodology, well stabilization will be determined through the measurement of specific water quality parameters (pH, temperature, specific conductance, dissolved oxygen, oxidation reduction potential, and turbidity) during the purging process. Purging will continue until these parameters have stabilized. Groundwater samples will be submitted for analysis of VOCs. In addition, GZA will collect and submit one set of QA/QC samples consisting of one duplicate to assess sample reproducibility and a VOC trip blank.

Should NAPL be present in the monitoring wells, it will be removed, and the recovery rate documented. Purge water generated during groundwater sampling will be field-screened for total VOCs with a PID and then placed in 55-gallon drums for subsequent characterization and off-Site disposal at a RI Energy approved facility. Any recovered NAPL will be segregated from the purge water to the extent practical, placed in a 55-gallon drum for subsequent characterization and off-Site disposal at a RI Energy approved facility.

11.0 ANTICIPATED SCHEDULE

With respect to anticipated schedule and sequence, RI Energy is prepared to proceed as outlined below in a timely manner upon receipt of a *Program Letter* from RIDEM confirming that RI Energy has adequately assessed the nature and extent of contamination at the Site. In developing this anticipated schedule, we have assumed receipt of this *Program Letter* by the end of January 2024.

- Public Notice: Winter 2024
- RIDEM Issuance of *Remedial Decision Letter*: Winter 2024
- Preparation and Submittal of *RAWP*: Spring – Summer 2024
- RIDEM Issuance of *Remedial Approval Letter*: Fall 2024
- Implementation of Remedial Construction: 2024 – Ongoing
- Preparation of *Remedial Action Closure Report*: Upon completion of Remedial Actions

12.0 CERTIFICATION

To address Section 1.8.5 of the Remediation Regulations, the following statements of certification are provided.

GZA GeoEnvironmental, Inc. certifies to the best of its knowledge, that this Site Investigation Report (SIR) Addendum, is complete and accurate.

A handwritten signature in blue ink, appearing to read 'MSK', is written over a horizontal line.

Margaret S. Kilpatrick, PE
Principal
GZA GeoEnvironmental, Inc.

RI Energy certifies, to the best of its knowledge, that this Site Investigation Report (SIR) Addendum, is a complete and accurate representation of the contaminated Site and the release(s) and contains all known facts surrounding the release.

Amy Willoughby
Lead Environmental Scientist
The Narragansett Electric Company d/b/a RI Energy

Notes

Location is located in the Natural Gas Regulator portion of the Property

Location is located at the LNG Facility

Location is located in the Former CNG Fueling Station portion of the Property

NE = Not Established

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Notes

Location is located in the Natural Gas Regulator portion of the Property

Location is located at the LNG Facility

Location is located in the Former CNG Fueling Station portion

NE = Not Established

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Location is located at the LNG Facility

Location is located in the Former CNG Fueling Station portion

NE = Not Established

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Notes:

| | |
|--------|--|
| CT | The characteristics of the chromatogram for these indicate that the product is composed exclusively of tar impacted hydrocarbons. The tar material present in these field samples indicate varying degrees of weathering. |
| CT/PET | The characteristics of the chromatogram for these indicate that the product is composed of a mixture of middle distillate, heavy petroleum and coal tar. The tar component was noted as highly weathered. |
| PET | The characteristics of the chromatogram for these indicate that the product is composed of largely middle distillate petroleum and to a lesser extent, heavy petroleum. The petroleum product was noted as highly weathered. |
| NA | = Not Applicable |

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Notes

NE = Not Established

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Notes

NE = Not Established

While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Gray shaded cells and bolded text indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC).

Blue shaded cells indicate that the detection limit exceeds the RIDEM Method 1 Criteria.

Concentrations underlined exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit (UCL).

A concentration shown with **red and bolded text** exceeds the RCRA Hazardous Waste Criteria.

J modifier - Estimated Concentration

D modifier - Analyte concentration obtained from dilution

B modifier - Analyte present in method blank

Notes
Well is located in the Natural Gas Regulator portion of the Property
Well is located at the LNG Facility
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD88
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

**TABLE 9
SUMMARY OF GROUNDWATER AND NAPL GAUGING RESULTS**

642 Allens Avenue
Providence, Rhode Island

| Site Area | Well ID | Surveyed Elevations | | | Well Installation Details | | | | | Range of LNAPL Observed (feet) | Range of DNAPL Observed (feet) | November 2013 | | | | | | | June 2014 | | | | | | | | |

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

Notes
Well is located in the Natural Gas Regulator portion of the Property
Well is located at the LNG Facility
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD88
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.
Note 2 - The readings reported from monitoring well Unknown-2 in the November 2020 column were collected on December 21, 2020.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

TABLE 9
SUMMARY OF GROUNDWATER AND NAPL GAUGING RESULTS

642 Allens Avenue
Providence, Rhode Island

Table with 27 columns: Site Area, Well ID, Surveyed Elevations (Top of Casing, Top of PVC, Grade), Well Installation Details (Type, Depth, Date, Measured, Screened), Range of LNAPL, Range of DNAPL, October 2014 (Depth to LNAPL, Water, DNAPL, Total Well, GW Elevation, LNAPL Thickness, DNAPL Thickness, Corrected Groundwater), April 2015 (Depth to LNAPL, Water, DNAPL, Total Well, GW Elevation, LNAPL Thickness, DNAPL Thickness, Corrected Groundwater).

Notes

- Well is located in the Natural Gas Regulator portion of the Property
Well is located at the LNG Facility
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD88
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.
Note 2 - The readings reported from monitoring well Unknown-2 in the November 2020 column were collected on December 21, 2020.

Notes

Well is located in the Natural Gas Regulator portion of the Property

Well is located at the LNG Facility

Well is located in the CNG Fueling Station portion of the Property

Elevations are relative to NAVD88

NP - Indicates No Product observed.

NS - Not Surveyed

Blanks indicate no measurement collected on that particular day.

Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

TABLE 9
SUMMARY OF GROUNDWATER AND NAPL GAUGING RESULTS

642 Allens Avenue
Providence, Rhode Island

Table with 29 columns: Site Area, Well ID, Surveyed Elevations (Top of Casing, Top of PVC, Grade), Well Installation Details (Type, Depth, Date, Measured Well, Screened Interval, Range of LNAPL, Range of DNAPL), and monthly data for October 2016 and May 2017 (Depth to LNAPL, Depth to Water, Depth to DNAPL, Total Well Depth, GW Elevation, LNAPL/ DNAPL Thickness, Corrected Groundwater Elevation).

Notes

Well is located in the Natural Gas Regulator portion of the Property
Well is located at the LNG Facility
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD88
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.
Note 2 - The readings reported from monitoring well Unknown-2 in the November 2020 column were collected on December 21, 2020.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

TABLE 9
SUMMARY OF GROUNDWATER AND NAPL GAUGING RESULTS

642 Allens Avenue
Providence, Rhode Island

| Site Area | Well ID | Surveyed Elevations | | | Well Installation Details | | | | | Range of LNAPL Observed (feet) | Range of DNAPL Observed (feet) | June 2019 | | | | | | | November 2019 | | | | | | | | |
|-----------|-----------|--------------------------------|-----------------------------|------------------------|---------------------------|---------------------|----------------------|--------------------------------|------------------------------|--------------------------------|--------------------------------|--------------------------------------|---------------------|---------------------|-----------------------|---------------------|------------------------|------------------------|--|---------------------|---------------------|---------------------|-----------------------|---------------------|------------------------|------------------------|--|
| | | Top of Casing Elevation (Feet) | Top of PVC Elevation (Feet) | Grade Elevation (Feet) | Type of Well | Well Depth Modifier | Date of Installation | Measured Well Depth (feet bgs) | Screened Interval (feet bgs) | | | Depth to LNAPL (ft) | Depth to Water (ft) | Depth to DNAPL (ft) | Total Well Depth (ft) | GW Elevation (feet) | LNAPL Thickness (feet) | DNAPL Thickness (feet) | Corrected Groundwater Elevation (feet) | Depth to LNAPL (ft) | Depth to Water (ft) | Depth to DNAPL (ft) | Total Well Depth (ft) | GW Elevation (feet) | LNAPL Thickness (feet) | DNAPL Thickness (feet) | Corrected Groundwater Elevation (feet) |

Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.
Note 2 - The readings reported from monitoring well Unknown-2 in the November 2020 column were collected on December 21, 2020.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

Notes
Well is located in the Natural Gas Regulator portion of the Property
Well is located at the LNG Facility
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD88
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.
Note 2 - The readings reported from monitoring well Unknown-2 in the November 2020 column were collected on December 21, 2020.

**TABLE 9
SUMMARY OF GROUNDWATER AND NAPL GAUGING RESULTS**

642 Allens Avenue
Providence, Rhode Island

| Site Area | Well ID | Surveyed Elevations | | | Well Installation Details | | | | | Range of LNAPL Observed (feet) | Range of DNAPL Observed (feet) | June 2021 | | | | | | | November 2021 | | | | | | | | |
|-----------|-----------|--------------------------------|-----------------------------|------------------------|---------------------------|---------------------|----------------------|--------------------------------|------------------------------|--------------------------------|--------------------------------|--|---------------------|---------------------|-----------------------|---------------------|------------------------|------------------------|--|---------------------|---------------------|---------------------|-----------------------|---------------------|------------------------|------------------------|--|

Notes
 Well is located in the Natural Gas Regulator portion of the Property
 Well is located at the LNG Facility
 Well is located in the CNG Fueling Station portion of the Property
 Elevations are relative to NAVD88
 NP - Indicates No Product observed.
 NS - Not Surveyed
 Blanks indicate no measurement collected on that particular day.
 Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.
 Note 1 - The readings reported from monitoring wells GZ-401 and GZ-403 in the October 2014 column were collected on November 3, 2015.

TABLE 12
SUMMARY OF SHEEN OBSERVATIONS
642 Allens Avenue
Providence, Rhode Island

| Date of Observation | Time of Observation | Approximate Tidal Stage | Approximate Location of Sheen Observed | Description of Sheen Observed |
|---------------------|----------------------------------|-------------------------|---|---|
| 9/22/2011 | 8:40 | Low | Along shoreline stretching from RCA-40 to RCA-3. | Small dull spots. |
| 9/22/2011 | 9:00 | Low | Outfall proximate to Motiva property. | Moderate dull bands. |
| 9/22/2011 | 9:15 | Low | Along shoreline stretching from RCA-40 to RCA-3. | Large dull bands and moderate dull spots. |
| 10/28/2011 | 9:00 | High | No sheens observed. Boom was repaired | |
| | 14:30 | Mid-Low | No sheens observed. | |
| 12/22/2011 | 10:40 | Low | Outside of Boom, along shoreline stretching from RCA-5 to RCA-20. | Moderate dull bands and small dull spots. |
| 12/22/2011 | 10:40 | Low | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Large dull bands and moderate dull spots. |
| 12/22/2011 | 11:00 | Low | Outfall proximate to Motiva property. | Very small dull spots |
| 2/3/2012 | 12:00 | Low-Mid | Outside of Boom, north of the RIPDES outfall (within cove) | Moderate dull spots |
| 2/8/2012 | 15:10 | Mid | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Small dull spots. |
| 2/15/2012 | 11:55 | Mid | Outside of Boom, along shoreline stretching from RCA-5 to RCA-20. | Small dull spots. |
| 2/15/2012 | 11:55 | Mid | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Large bright bands. |
| 2/23/2012 | 15:00 | Low | No sheens observed. | |
| 3/2/2012 | 14:20 | High | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Minor to moderate dull spots and bands of sheen |
| 3/2/2012 | 14:30 | High | Outfall proximate to Motiva property. | Large bright bands. |
| 3/9/2012 | 13:10 | Low | Outside of boom, along shoreline stretching from CHES RW-5 to RW-3. | Moderate to minor dull spots of sheen |
| 3/9/2012 | 13:05 | Low | Outfall proximate to Motiva property. | Slight bright bands of sheen |
| 4/13/2012 | 10:53 | Mid | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Moderate to minor dull spots of sheen |
| 4/13/2012 | 10:58 | Mid | Outfall proximate to Motiva property. | Slight bright bands of sheen |
| 5/16/2012 | 13:45 | Mid-High | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Minor to moderate dull bands of sheen |
| 5/16/2012 | 13:45 | Mid-High | Outfall proximate to Motiva property. | Moderate bright bands of sheen |
| 6/29/2012 | 9:35 | Low | Outside of boom, near LNG tank | Bright large sheen spot |
| 6/29/2012 | 9:35 | Low | Within the boom, along shoreline stretching from CHES RW-5 to RW-3. | Bright to dull bands of sheen |
| 6/29/2012 | 9:45 | Low | Outfall proximate to Motiva property. | Slight dull spots |
| 7/19/2012 | 9:50 | Low | Outside of Boom, north of the RIPDES outfall (within cove) to Propane House | Bright moderate sheen spots |
| 7/19/2012 | 9:50 | Low | Outfall proximate to Motiva property. | Bright moderate sheen spots |
| 8/2/2012 | 8:45 | High | Within the boom, along shoreline at CHES RW-4. Boom was repaired. | |
| 8/24/2012 | 10:10 | Mid | Outside of boom, near CHES RW-4 | Bright moderate sheen spot |
| 8/24/2012 | 10:10 | Mid | Within the boom, from CHES RW-4 to Propane House | Bright moderate sheen spots and bands |
| 8/24/2012 | 10:10 | Mid | Outside of boom, from Propane House to RCA-3 | Bright slight sheen spots and bands |
| 8/24/2012 | 10:10 | Mid | Outfall proximate to Motiva property. | Bright slight sheen spots and bands |
| 9/6/2012 | No sheens observed at high tide. | | | |
| 9/13/2012 | 11:20 | Low | Within the boom, near CHES RW-4 | Bright slight sheen bands |
| 9/13/2012 | 11:45 | Low | Outside of boom, near CHES RW-4 | Bright slight sheen spot |
| 9/13/2012 | 11:45 | Low | Within the boom, between CHES RW-3 and CHES RW-4 | Bright moderate bands and spots of sheen |
| 9/25/2012 | 14:00 | Mid | Outfall proximate to Motiva property. | Slight bright bands of sheen |
| 10/31/2012 | 10:15 | High | Within the boom, near CHES RW-4 | Slight bright spots of sheen |
| 11/19/2012 | No sheens observed at high tide. | | | |
| 11/20/2012 | 16:20 | Mid-High | Within the boom, between CHES RW-3 and CHES RW-4. Boom was repaired. | Moderate long bright bands of sheen |
| 12/20/2012 | 12:00 | Mid-High | No sheens observed. | |

TABLE 12
SUMMARY OF SHEEN OBSERVATIONS
642 Allens Avenue
Providence, Rhode Island

| Date of Observation | Time of Observation | Approximate Tidal Stage | Approximate Location of Sheen Observed | Description of Sheen Observed |
|---------------------|---------------------|-------------------------|--|---|
| 1/4/2013 | | | No sheen observed at high tide. | |
| 2/1/2013 | | | No sheens observed at high tide. High wind was also noted. | |
| 2/26/2013 | 12:48 | Low | Within the boom, near CHES RW-4 | Slight bright spots of sheen |
| 2/26/2013 | 12:52 | Low | Within the boom, between CHES RW-3 and CHES RW-4 | Slight bright spots of sheen |
| 2/26/2013 | 12:56 | Low | Outfall proximate to Motiva property. | Moderate long bright bands of sheen |
| 3/22/2013 | 11:22 | Low | Within the boom, between CHES RW-3 and CHES RW-4 | Moderate bright bands of sheen |
| 3/25/2013 | 11:00 | Low | Within the boom, within sediments exposed at low tide between CHES RW-3 and CHES RW-4 | Slight sheen spots |
| 4/2/2013 | 11:00 | Mid | Within the boom, near CHES RW-4 | Bright bands of sheen |
| 4/24/2013 | | | No sheens observed at high tide. | |
| 4/30/2013 | | | No sheens observed at high tide. | |
| 5/6/2013 | | | No sheens observed at high tide. | |
| 5/14/2013 | 8:15 | Mid-High | Within the boom, between CHES RW-3 and CHES RW-4 | Bands of dull sheen |
| 5/24/2013 | | | No sheens observed at mid-high tide. | |
| 5/31/2013 | 8:00 | Low | Within the boom, between CHES RW-3 and CHES RW-5 | Slight dull bands and spots |
| 5/31/2013 | 9:45 | Mid | Within the boom, between CHES RW-3 and CHES RW-5 | Slight to moderate dull bands and spots |
| 5/31/2013 | 9:50 | Mid | Within the boom, within sediments exposed at mid tide between CHES RW-3 and CHES RW-4 | Bright spots of sheen |
| 6/2/2013 | | | No sheens observed at mid tide. High wind was also noted. | |
| 6/3/2013 | 9:10 | Low | Outside the boom, directly near the repair area (proximate to the gate area) in the LNG portion of the property | Bright to dull spots and blebs of sheen |
| 6/3/2013 | 9:10 | Low | Within the boom, between CHES RW-3 and CHES RW-5 | Moderate dull bands of sheen |
| 6/3/2013 | 12:30 | Mid | Within the boom, between CHES RW-3 and CHES RW-5 | Slight dull bands of sheen |
| 6/3/2013 | 13:15 | Mid | Outside the boom, along the edge of the LNG portion of the property, directly adjacent to the pathway. The sheen was noted as originating from the western part of the cove. | Slight dull bands of sheen |
| 6/10/2013 | | | No sheens observed at high tide. | |
| 6/11/2013 | 12:30 | Mid-High | Within the boom, between CHES RW-3 and CHES RW-5 | Moderate bright bands of sheen |
| 6/13/2013 | 14:25 | Mid | Within the boom, proximate to CHES RW-5 | Moderate dull to bright bands and spots |
| 6/19/2013 | | | No sheens observed at high tide. | |
| 6/20/2013 | 8:30 | Mid | Within the boom, between CHES RW-3 and CHES RW-5 | Moderate bright bands of sheen |
| 6/25/2013 | 11:00 | High | Within the boom, near CHES RW-4 | Slight bright spots of sheen |
| 7/31/2013 | | | No sheens observed at high tide. | |
| 8/28/2013 | 12:30 | Mid-High | Within the boom, directly near the repair area (proximate to the gate area) in the LNG portion of the property | Very slight bright spots |
| 9/5/2013 | 15:06 | Low | Within the boom, near CHES RW-4 | Bright to dull spots and blebs of sheen |
| 9/27/2013 | | | No sheens observed at high tide. High wind was also noted. | |
| 10/30/2013 | 8:30 | Mid | Within the boom, directly near the repair area (proximate to the gate area) in the LNG portion of the property | Very slight bright spots |
| 11/19/2013 | | | No sheens observed at high tide. High wind was also noted. | |
| 12/20/2013 | 10:15 | Mid - Low | Within the boom, directly near the repair area (proximate to the gate area) in the LNG portion of the property | Very slight bright spots |

**TABLE 12
SUMMARY OF SHEEN OBSERVATIONS**

642 Allens Avenue
Providence, Rhode Island

File No. 03.00033554.01
5/6/2022

| Date of Observation | Time of Observation | Approximate Tidal Stage | Approximate Location of Sheen Observed | Description of Sheen Observed |
|---------------------|--|-------------------------------|--|---|
| 1/27/2014 | 9:53 | Low | Outfall proximate to Motiva property. | Slight bright bands of sheen |
| 2/25/2014 | 14:00 | Mid - High | Within the boom, between CHES RW-3 and CHES RW-4 | Slight dull bands of sheen |
| 3/20/2014 | 9:15 | Mid - High | Within the boom, between CHES RW-3 and CHES RW-5. Boom was repaired. | Moderate long dull bands of sheen |
| 4/29/2014 | 12:30 | Mid-Low | Within the boom, between CHES RW-4 and CHES RW-5 | Slight dull bands of sheen |
| | 12:40 | | Outfall proximate to Motiva property. | Slight bright spots of sheen |
| 5/22/2014 | No sheens observed at high tide. High wind and rain were also noted. | | | |
| 6/3/2014 | No sheens observed at high tide. | | | |
| 7/24/2014 | No sheens observed at high tide. | | | |
| 8/24/2014 | No sheens observed at high tide. High wind was also noted. | | | |
| 9/24/2014 | 10:25 | High-Mid | Within the boom, near CHES RW-3 | Slight dull sheen spots and bands |
| | 10:30 | | Within the boom, near Propane House | Moderate dull to bright bands and spots |
| 10/30/2014 | 7:30 | Low | Inside and outside boom, between CHES RW-3 and CHES RW-5 | Slight bands of dull sheen |
| | | | Within the boom, near CHES RW-3 | Strong bright bands of sheen |
| 11/13/2014 | No sheens observed at high tide. Boom was repaired. | | | |
| 12/12/2014 | 14:00 | Mid | Within the boom, near CHES RW-3 | Slight dull bands of sheen |
| 1/29/2015 | No sheens observed at mid tide. | | | |
| 2/25/2015 | No sheens observed. Cove completely frozen over. | | | |
| 3/23/2015 | No sheens observed at high tide. High wind was also noted. | | | |
| 4/9/2015 | No sheens observed at high tide. High wind was also noted. Hard boom and absorbent boom were replaced. | | | |
| 5/22/2015 | 7:43 | Low | Within the boom, near CHES RW-3 | Very slight bright spots |
| 6/17/2015 | No sheens observed at mid tide. High wind was also noted. | | | |
| 7/17/2015 | 11:29 | Mid | Within the boom, between CHES RW-3 and RCA-5 | Moderate to bright spots of sheen |
| 8/28/2015 | 12:20 | Low | Inside and outside boom, between CHES RW-3 and CHES RW-5 | Moderate dull spots of sheen |
| 9/16/2015 | 9:40 | Mid-High | Within the boom, near CHES RW-3 | Slight dull bands of sheen |
| 10/14/2015 | No sheens observed at high tide. | | | |
| 11/17/2015 | No sheens observed at high tide. Boom was repaired. | | | |
| 12/30/2015 | No sheens observed at high tide. | | | |
| 1/29/2016 | No sheens observed at mid tide. | | | |
| 2/22/2016 | 12:00 | Mid-High | Within Boom near CHES RW-3 | Slight sheen spots |
| 3/16/2016 | 8:30 | Mid-High | Within Boom between CHES RW-3 and CHES RW-5 | Minor sheening. Dull to bright streaks of sheen |
| 4/28/2016 | 3:30 | Mid-High | Within Boom near CHES RW-3 | Bright Plates/Streaks of Sheen |
| 5/19/2016 | 11:00 | Mid-Low | Within Boom near CHES RW-3 | Dull plates of sheen |
| 6/10/2016 | No sheens observed at mid-high tide. | | | |
| 7/26/2016 | 10:00 | Low | Within Boom near CHES RW-3 | Slight sheen |
| 8/30/2016 | 13:00 | Low | Inside and outside boom, between CHES RW-3 and CHES RW-5 | Plates of sheen |
| 9/16/2016 | 9:00 | High | Within Boom | Slight Sheen (Streaks) |
| 10/30/2016 | No sheens observed | | | |
| 11/30/2016 | 11:00 | Mid | Within Boom near CHES RW-3 | Platlets of sheen |
| 12/13/2016 | 11:45 | No sheen observed at low tide | | |

TABLE 12
SUMMARY OF SHEEN OBSERVATIONS
642 Allens Avenue
Providence, Rhode Island

| Date of Observation | Time of Observation | Approximate Tidal Stage | Approximate Location of Sheen Observed | Description of Sheen Observed |
|---------------------|---------------------|-------------------------|---|--|
| 1/31/2017 | | | No sheens observed at mid tide | |
| 2/27/2017 | 9:00 | Mid-Low | Within Boom near CHES RW-3 | Streaks of sheen |
| 3/24/2017 | | | No sheens observed at high tide | |
| 4/28/2017 | | | No sheens observed at high tide | |
| 5/5/2017 | | | No sheens observed at high tide | |
| 6/30/2017 | | | No sheens observed at high tide | |
| 7/27/2017 | | | No sheens observed at high tide | |
| 8/1/2017 | 16:00 | High | Within Boom near CHES RW-3 | Some plates of sheen |
| 9/1/2017 | 12:50 | Mid | Within Boom near CHES RW-3 | Dull streaks of sheen |
| 9/29/2017 | 11:00 | Mid-High | Within Boom near CHES RW-3 | Some streaks of sheen |
| 10/24/2017 | | | No sheens observed at high tide | |
| 11/21/2017 | | | No sheens observed at high tide | |
| 12/21/2017 | | | No sheens observed at low tide | |
| 1/24/2018 | 13:00 | | No sheens observed at high tide | |
| 2/21/2018 | 12:00 | | No sheens observed at high tide | |
| 3/20/2018 | 11:00 | | No sheens observed at high tide | |
| 4/26/2018 | 7:00 | | No sheens observed at high tide | |
| 5/15/2018 | 14:00 | | No sheens observed at low tide | |
| 6/28/2018 | 14:00 | | No sheens observed at low tide | |
| 7/30/2018 | 13:00 | Mid | Along shoreline. | Some streaks of sheen, dull to bright plates |
| 8/30/2018 | 9:30 | Mid-high | Between hard boom and shore | Dull streaks of sheen |
| 10/1/2018 | 7:00 | Low | Between hard boom and shore | Bright streaks of sheen |
| 10/30/2018 | 10:30 | | No sheens observed at mid tide | |
| 11/14/2018 | 7:00 | | No sheens observed at high tide | |
| 12/19/2018 | 11:15 | Low tide | No sheens observed | |
| 1/30/2019 | 11:00 | Low tide | Between hard boom and shore proximate to former well RW-3 | Dull streaks of sheen |
| 2/27/2019 | 13:00 | Mid-high tide | Between hard boom and shore proximate to former well RW-3 | Dull plates and streaks of sheen |
| 3/20/2019 | 13:00 | Low | Between hard boom and shore proximate to former well RW-3 | Dull plates and bright streaks of sheen |
| 4/22/2019 | 11:00 | | No sheens observed at high tide | |
| 5/31/2019 | 7:00 | | No sheens observed at high tide | |
| 6/26/2019 | 15:00 | High | Between hard boom and shore proximate to former well RW-3 | Dull plates of sheen |
| 7/25/2019 | 14:30 | High | Between hard boom and shore proximate to former well RW-3 | Dull plates of sheen |
| 8/22/2019 | 13:00 | High | Between hard boom and shore proximate to former well RW-3 | Dull plates of sheen |
| 9/27/2019 | 7:00 | | No sheens observed at high tide | |
| 10/21/2019 | 14:30 | | No sheens observed at high tide | |
| 11/21/2019 | 10:00 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | Dull plates of sheen |
| 12/18/2019 | 9:00 | | No sheens observed at mid tide | |

TABLE 12
SUMMARY OF SHEEN OBSERVATIONS
642 Allens Avenue
Providence, Rhode Island

| Date of Observation | Time of Observation | Approximate Tidal Stage | Approximate Location of Sheen Observed | Description of Sheen Observed |
|---------------------|---------------------|-------------------------|---|---------------------------------------|
| 1/24/2020 | 8:30 | Mid Tide | Along shoreline proximate to former well RW-3. | Dull to bright plates of sheen |
| 2/24/2020 | 12:00 | | No sheens observed at low tide | |
| 3/26/2020 | 12:45 | | No sheens observed at mid to high tide | |
| 4/23/2020 | 8:00 | | No sheens observed at high tide | |
| 5/22/2020 | 8:45 | | No sheens observed at high tide | |
| 6/9/2020 | 15:00 | | No sheens observed at mid to low tide | |
| 7/17/2020 | 12:30 | Mid-low Tide | Along shoreline proximate to former well RW-3. | Slight dull to bright plates of sheen |
| 8/11/2020 | 7:15 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | Large dull to bright plates of sheen |
| 8/20/2020 | 12:15 | | No sheens observed at mid to low tide | |
| 9/22/2020 | 9:00 | | No sheens observed at mid to high tide | |
| 10/26/2020 | 12:00 | | No sheens observed at low tide | |
| 11/24/2020 | 7:00 | | No sheens observed at mid to high tide | |
| 12/11/2020 | 10:37 | Low Tide | Between hard boom and shore proximate to former well RW-3 | Minor dull to bright plates of sheen |
| 1/22/2021 | 13:37 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | |
| 2/9/2021 | 7:07 | High-tide | Between hard boom and shore proximate to former well RW-3 | Minor dull plates of sheen |
| 3/15/2021 | 8:54 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | |
| 4/20/2021 | 11:51 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | |
| 5/21/2021 | 13:14 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | Minor dull plates of sheen |
| 6/23/2021 | 10:00 | Low-tide | Between hard boom and shore proximate to former well RW-3 | Minor dull plates of sheen |
| 7/26/2021 | 7:29 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | Large bright plates of sheen |
| 8/13/2021 | 10:39 | High-tide | Between hard boom and shore proximate to former well RW-3 | Minor dull plates of sheen |
| 9/27/2021 | 10:10 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | Minor dull plates of sheen |
| 10/18/2021 | 15:01 | Mid Tide | Between hard boom and shore proximate to former well RW-3 | |
| 11/18/2021 | 12:10 | Low-tide | Between hard boom and shore proximate to former well RW-3 | |
| 12/20/2021 | 10:23 | High-tide | Between hard boom and shore proximate to former well RW-3 | |

2. A water line directly proximate to the Providence River at the LNG facility unexpectedly failed on May 31, 2013. This water line provided fire protection for the LNG facility. Immediate response actions included deploying additional absorbent booms, repairing a rip-rap slope and temporarily repairing the line for fire protection. The water line was replaced in the fall of 2013. Additional boom was deployed on May 31, 2013 and June 3, 2013 after additional sheens were observed outside the original boom configuration.

 - ELECTRONIC CAD FILE WA216268_EX01_LINEWORK.DWG, TITLED "GPRS UTILITY FINDINGS MAP", PREPARED BY GPRS, INC. FOR GZA, DATED 9/10/2020. ORIGINAL SCALE 1" = 25'.
 - ELECTRONIC CAD FILE ALLENSAVEOUTLET.DWG, TITLED "ABANDONMENT OF ALLENS AVE PIPING", SHEET 2 OF 2, PREPARED BY SGC ENGINEERING, LLC FOR NATIONAL GRID ON APRIL 4, 2022, ORIGINAL SCALE 1"=10'.
 - ON-SITE INVESTIGATIONS AND SURVEYS BY GZA PERSONNEL DURING VARIOUS SITE VISITS BETWEEN 2011 AND 2020.
- PROPERTY LINES AND LOT INFORMATION ESTABLISHED FROM INFORMATION PROVIDED ON A DRAWING ENTITLED "EXISTING CONDITIONS PLAN," PROJECT TITLE "NATIONAL GRID LNG TERMINAL ROAD LNG FACILITY" DATED MARCH 10, 2014, ORIGINAL SCALE 1" = 50', DRAWING NO. SV-1 THROUGH SV-3.
- EXPLORATION LOCATION PLANS WERE DEVELOPED FROM THE FOLLOWING:
 - SITE PLANS PROVIDED BY RESOURCE CONTROLS ASSOCIATES (RCA) IN THE RIDEM-SUBMITTED JULY 5, 1994 "SITE CHARACTERIZATION PLAN" PREPARED ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY RCA IN THE RIDEM-SUBMITTED JUNE 28, 1996 "PHASE IB FIELD CHARACTERIZATION INVESTIGATION" PREPARED ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY ENVIRONMENTAL SCIENCE SERVICES, INC. (ESS) IN THE RIDEM-SUBMITTED DECEMBER 4, 1998 "REMEDIAL ACTION WORK PLAN (RAWP)" PREPARED ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY ESS IN THE RIDEM-SUBMITTED OCTOBER 21, 1999 "SUBSURFACE INVESTIGATION AND PROPOSED ALGONQUIN GENERATOR CONSTRUCTION AREA" PREPARED ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY VHB IN THE RIDEM-SUBMITTED NOVEMBER 2002 "REMEDIAL ACTION CLOSURE REPORT" PREPARED ON BEHALF OF THE NEW ENGLAND GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY VHB IN THE RIDEM-SUBMITTED APRIL 2003 "SITE INVESTIGATION REPORT" PREPARED ON BEHALF OF THE NEW ENGLAND GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - SITE PLANS PROVIDED BY VHB IN THE RIDEM-SUBMITTED JANUARY 26, 2009 "OXIDE BOX INVESTIGATION TECHNICAL MEMORANDUM" PREPARED ON BEHALF OF THE NARRAGANSETT ELECTRIC COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - FIGURE 3 "EXPLORATION LOCATION PLAN" PREPARED BY GZA (GZA) ON BEHALF OF CHICAGO BRIDGE AND IRON (CB&I) IN JULY 2005. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - FIGURE 35 "TEST BORINGS UNDER SASSAFRAS POINT PLAT" DATED JUNE 5, 1912 PREPARED BY THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - DRAWING 3 "WHARF FACILITIES - BULKHEAD REBUILDING - CROSS SECTIONS" DATED JANUARY 11, 1973 PREPARED BY PARSONS, BRINCKERHOFF, QUADE AND DOUGLAS ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - FIGURE 2 "EXPLORATION LOCATION PLAN," DATED SEPTEMBER 18, 2015, BY WEIDLINGER ASSOCIATES, INC. (WEI) ON BEHALF OF KIEWIT CORPORATION (KIEWIT). PLAN PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - DRAWING A03 DATED JANUARY 2015, BY PROCESS PIPELINE, INC. ON BEHALF OF THE NARRAGANSETT ELECTRIC COMPANY. PLAN PREPARED BY THE NARRAGANSETT ELECTRIC COMPANY.

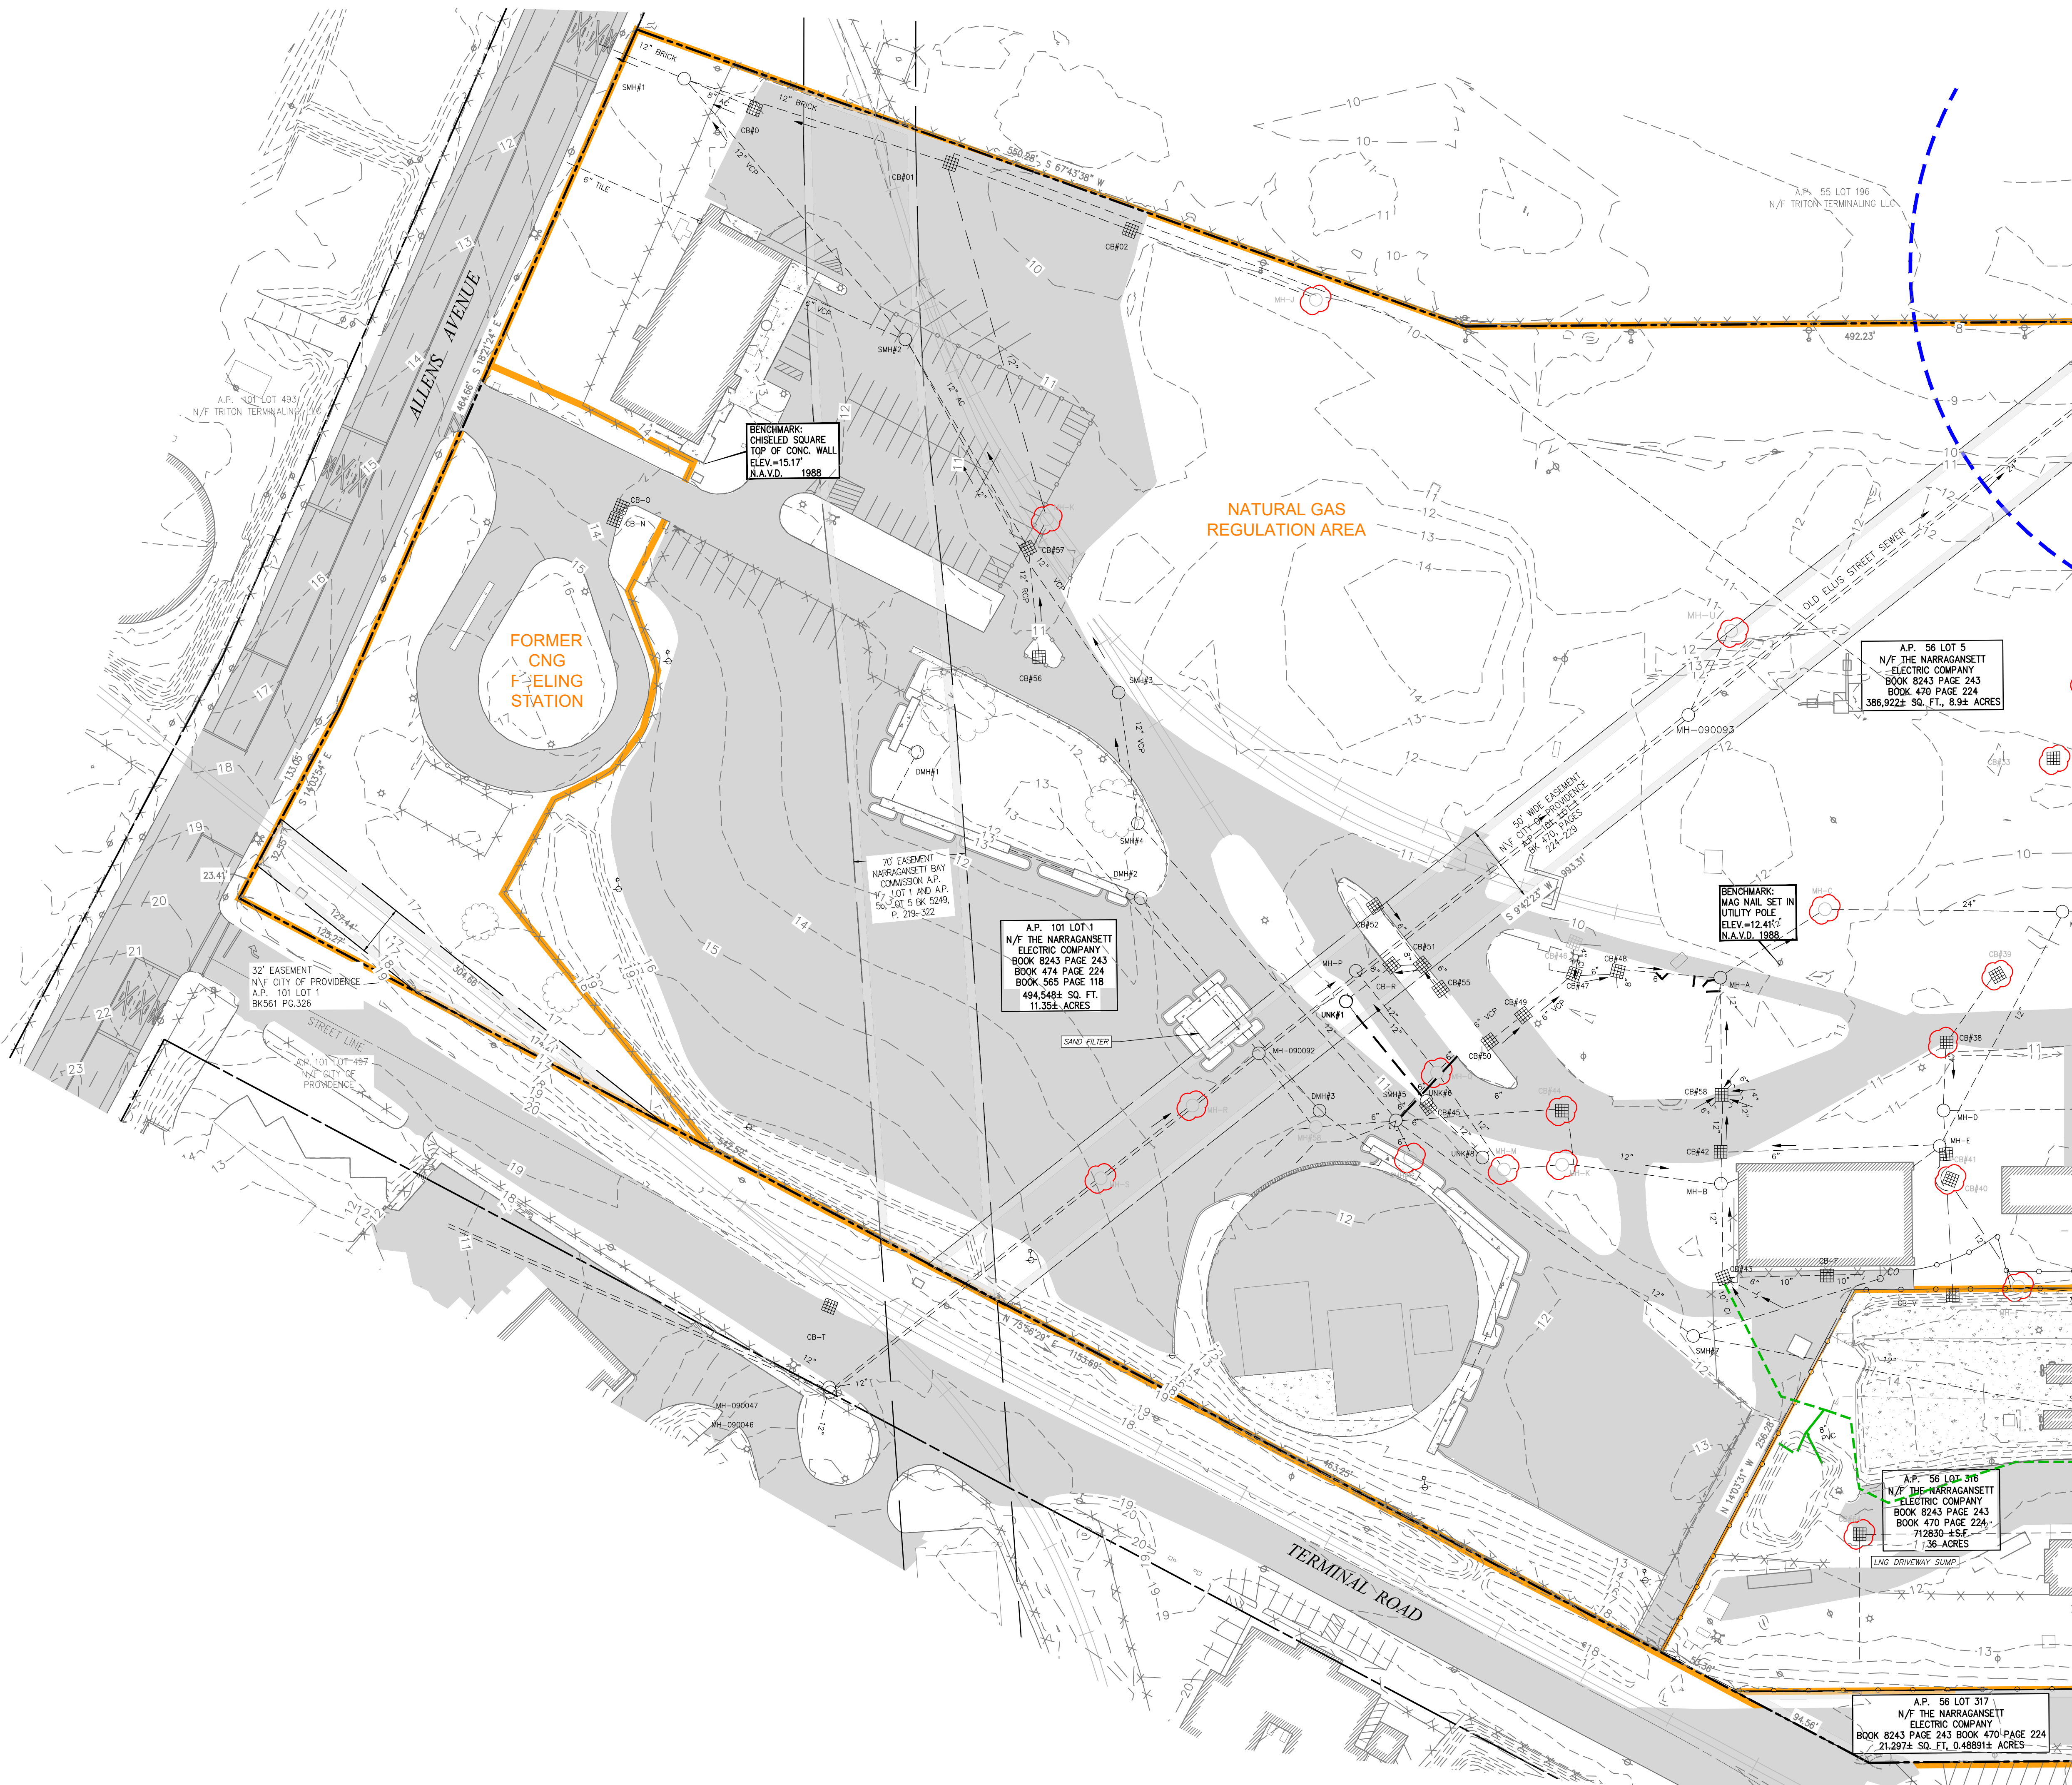

- DRAWING 2 "PROPOSED EXPLORATION LOCATION PLAN" DATED SEPTEMBER 2019, BY GZA ON BEHALF OF HDR, INC.
- DRAWING 5153_C00_SENT OUT 05-03-16) DWG BY PROCESS PIPELINE SERVICES OF WALPOLE MASSACHUSETTS TITLED "SITE PLAN" SHEET A02, DATED APRIL 27, 2016 AND PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY ON MAY 6, 2016.
- FIGURE 2 "EXPLORATION LOCATION PLAN," DATED MARCH 22, 2016, BY GOLDER ASSOCIATES ON BEHALF OF CHI ENGINEERING SERVICES, INC. PLAN PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
- ELECTRONIC CAD FILE "ACAD-7257PL.DWG" PROVIDED BY VANASSE HANGEN BRUSTLIN (VHB) ENTITLED "EXISTING CONDITIONS PLAN," PROJECT TITLE "NATIONAL GRID LNG TERMINAL ROAD LNG FACILITY" DATED MARCH 10, 2014, ORIGINAL SCALE 1" = 50', DRAWING NO. SV-1 THROUGH SV-3 AND AERIAL MAPPING BY WSP TRANSPORTATION AND INFRASTRUCTURE DATED JANUARY 15, 2014 PREPARED FOR THE NARRAGANSETT ELECTRIC COMPANY LAND SURVEYING DEPARTMENT, WALTHAM, MASSACHUSETTS AND CAD FILE NO. 09303023.052-1.DWG. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
- ON-SITE INVESTIGATIONS AND SURVEYS BY GZA PERSONNEL DURING VARIOUS SITE VISITS BETWEEN 2011 AND 2021.
- THE LOCATION OF THE EXPLORATIONS AND MONITORING WELLS AT THE SITE WERE APPROXIMATELY DETERMINED AND HAVE BEEN ALIGNED AND ADJUSTED FOR THE "BEST FIT" AND THESE DATA SHOULD BE CONSIDERED ACCURATE ONLY TO THE DEGREE IMPLIED BY THE METHOD USED.
- HORIZONTAL DATUM IS BASED ON NAD 1983 FROM BASE MAPPING PROVIDED BY VHB.
- VERTICAL DATUM IS BASED ON NAVD 1988 FROM BASE MAPPING PROVIDED BY VHB.
- EASEMENT LOCATIONS WERE DEVELOPED FROM THE FOLLOWING:
 - ELECTRONIC CAD FILE "ACAD-7257PL.DWG" PROVIDED BY VANASSE HANGEN BRUSTLIN (VHB) ENTITLED "EXISTING CONDITIONS PLAN," PROJECT TITLE "NATIONAL GRID LNG TERMINAL ROAD LNG FACILITY" DATED MARCH 10, 2014, ORIGINAL SCALE 1" = 50', DRAWING NO. SV-1 THROUGH SV-3 AND AERIAL MAPPING BY WSP TRANSPORTATION AND INFRASTRUCTURE DATED JANUARY 15, 2014 PREPARED FOR NATIONAL GRID LAND SURVEYING DEPARTMENT, WALTHAM, MASSACHUSETTS AND CAD FILE NO. 09303023.052-1.DWG. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - DESCRIPTIONS PROVIDED IN THE CITY OF PROVIDENCE DEED BOOK (BK) 470 PAGES 224 - 229, BK 561 PAGES 326 - 328, BK 1111 PAGES 752 - 756 AND BK 5249 PAGES 219 - 322.
- SELECT PRESENTED SITE UTILITIES WERE TAKEN FROM HISTORIC FIGURES PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY. ALL UTILITY LOCATIONS ARE APPROXIMATE AND HAVE BEEN ALIGNED AND ADJUSTED FOR THE "BEST FIT" AND THESE DATA SHOULD BE CONSIDERED ACCURATE ONLY TO THE DEGREE IMPLIED BY THE METHOD USED. UTILITIES ARE SHOWN FOR REFERENCE ONLY. OTHER LOCATIONS MAY EXIST.
- APPROXIMATE HISTORICAL STRUCTURE/EQUIPMENT LOCATIONS AND DATES WERE OBTAINED FROM THE FOLLOWING SOURCES:
 - CERTIFIED SANBORN MAPS DATED: 1950, 1956, 1972, 1977 AND 1982
 - AERIAL ORTHOPHOTOGRAPHIC IMAGES OBTAINED FROM RIGIS: 1939, 1951, 1962, 1972, 1976, 1981, 1988, 1992, 1995, 1997, 2002, 2008
 - SITE PLANS PROVIDED BY RESOURCE CONTROLS ASSOCIATES (RCA) IN THE RIDEM-SUBMITTED JULY 5, 1994 "SITE CHARACTERIZATION PLAN" PREPARED ON BEHALF OF THE PROVIDENCE GAS COMPANY. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
 - HISTORIC SITE PLAN "GENERAL PLAN OF WORKS, PROVIDENCE GAS COMPANY, SASSAFRAS POINT PLANT, PROVIDENCE, RHODE ISLAND," UNDATED. PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY.
- THE SITE HAS BEEN THE LOCATION OF NUMEROUS REMEDIAL ACTIONS (AS PRESENTED ON FIGURE 6). THIS PLAN SET DOES NOT PRESENT THE LOCATIONS OF ANY CONFIRMATORY SAMPLES THAT HAVE BEEN COLLECTED AT THE SITE. THIS PLAN SET MAY INCLUDE LOCATIONS THAT HAVE BEEN FULLY EXCAVATED AND THE PRESENTED EXPLORATIONS MAY NOT BE TRUE TO CURRENT CONDITIONS.
- THIS PLAN SET DOES NOT PRESENT THE LOCATIONS OF SAMPLES THAT WERE COLLECTED FOR GEOTECHNICAL PURPOSES ONLY. THIS INCLUDES CONE PENETROMETER TESTING SAMPLES AND TEST PITS CONDUCTED WITH NO SOIL DESCRIPTIONS OR ENVIRONMENTAL SAMPLES COLLECTED. HOWEVER, THE LOCATIONS OF KNOWN GEOTECHNICAL BORINGS (PRESENTED ON PLANS PROVIDED BY THE NARRAGANSETT ELECTRIC COMPANY) ARE PRESENTED IN THIS PLAN SET.
- LOGS FROM GEOTECHNICAL BORINGS SERIES PGC (1912 GEOTECHNICAL BORINGS PERFORMED FOR THE PROVIDENCE GAS COMPANY) AND SERIES B (1973 GEOTECHNICAL BORINGS PERFORMED FOR THE PROVIDENCE GAS COMPANY) CONSIST OF FENCE DIAGRAMS ONLY.

GROUNDWATER CONTOUR NOTES:

1. SHALLOW GROUNDWATER CONTOURS (NAVD 1988 MSL) ARE BASED ON DATA FROM WIDELY SPACED EXPLORATIONS AND MAY NOT REFLECT ACTUAL SUBSURFACE CONDITIONS. WATER LEVEL READINGS WERE ON MAY 18, 2016
2. WATER LEVEL READINGS HAVE BEEN MADE IN THE MONITORING WELLS AT THE TIMES AND UNDER THE CONDITIONS STATED IN THE TEXT OF THIS REPORT. THESE DATA HAVE BEEN REVIEWED AND INTERPRETATIONS MADE IN THE TEXT OF THIS REPORT. HOWEVER, FLUCTUATIONS IN THE LEVEL OF THE GROUNDWATER MAY OCCUR DUE TO VARIATIONS IN RAINFALL, TEMPERATURE AND OTHER FACTORS.
3. 2016 WAS THE LAST COMPREHENSIVE YEAR THAT SITE WIDE MONITORING WELLS WAS AVAILABLE.

APPENDIX A

LIMITATIONS

GEOHYDROLOGICAL LIMITATIONS

1. This *Site Investigation Report (SIR) Addendum* has been prepared on behalf of and for the exclusive use of The Narragansett Electric Company (TNEC), solely for use in documenting the conditions observed at the property located at 642 Allens Avenue in Providence, Rhode Island ("Site"). This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, nor used by any other party in whole or in part, without the prior written consent of GZA or TNEC.
2. GZA's work was performed in accordance with generally accepted practices of other consultants undertaking similar studies at the same time and in the same geographical area, and GZA observed that degree of care and skill generally exercised by other consultants under similar circumstances and conditions. GZA's findings and conclusions must be considered not as scientific certainties, but rather as our professional opinion concerning the significance of the limited data gathered during the course of the study. No other warranty, express or implied is made. Specifically, GZA does not and cannot represent that the Site contains no hazardous material, oil, or other latent condition beyond that observed by GZA during the performance of our Site investigations.
3. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based upon services performed and observations made by GZA.
4. In the event that National Grid or others authorized to use this report obtain information on environmental or hazardous waste issues at the Site not contained in this report, such information shall be brought to GZA's attention forthwith. GZA will evaluate such information and, on the basis of this evaluation, may modify the conclusions stated in this report.
5. The conclusions and recommendations contained in this report are based in part upon the data obtained from environmental samples obtained from relatively widely spread subsurface explorations. The nature and extent of variations between these explorations may not become evident until further exploration. If variations or other latent conditions then appear evident, it will be necessary to reevaluate the conclusions and recommendations of this report.
6. The generalized soil profile described in the text is intended to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized and have been developed by interpretations of widely spaced explorations and samples; actual soil transitions are probably more gradual. For specific information, refer to the boring logs.

7. In the event this work included the collection of water level data, these readings have been made in the test pits, borings and/or observation wells at times and under conditions stated on the exploration logs. These data have been reviewed and interpretations have been made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall and other factors different from those prevailing at the time measurements were made.

8. The conclusions contained in this report are based in part upon various types of chemical data and are contingent upon their validity. These data have been reviewed and interpretations made in the report. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by GZA and the conclusions and recommendations presented herein modified accordingly.

APPENDIX B

SIR CHECKLIST

Section 1.20 of the "Remediation Regulations"

Site Investigation Report (SIR) Checklist

(The following information shall be completed and submitted with the SIR)

Contact Name:
Contact Address:
Contact Telephone:

Site Name:
Site Address:

OFFICE USE ONLY

SITE INVESTIGATION REPORT (SIR) SITE:
PROJECT CODE:
SIR SUBMITTAL DATE:
CHECKLIST SUBMITTAL DATE:

DIRECTIONS: *The box to the left of each item listed below is for the administrative review of the SIR submission and is for **RIDEM USE ONLY**. Under each item listed below, cross-reference the specific sections and pages in the SIR that provide detailed information that addresses each stated requirement. Failure to include cross-references may delay review and approval. If an item is not applicable, simply state that it is not applicable and provide an explanation in the SIR.*

- 1.8.3(A)(1) List specific objectives of the SIR related to characterization of the Release, impacts of the Release and remedy.
- 1.8.3(A)(2) Include information reported in the Notification of Release. A copy of the Release notification form should be included in the SIR. Include information relating to short-term response, if applicable.
- 1.8.3(A)(3) Include documentation of any past incidents or Releases.
- 1.8.3(A)(4) Include list of prior property Owners and Operators, as well as sequencing of property transfers and time periods of occupancy.
- 1.8.3(A)(5) Include previously existing environmental information which characterizes the Contaminated-Site and all information that led to the discovery of the Contaminated-Site.
- 1.8.3(A)(6) Include current uses and zoning of the Contaminated-Site, including brief statements of operations, processes employed, waste generated, Hazardous Materials handled, and any residential activities on the site, if applicable. (This section should be linked to the specific objectives section demonstrating how the compounds of concern in the investigation are

those that are used or may have been used on the site or are those that may have impacted the site from an off-site source.)

1.8.3(A)(7) Include a locus map showing the location of the site using US Geological Survey 7.5-min quadrangle map or a copy of a section of that USGS map.

1.8.3(A)(8) Include a site plan, to scale, showing:

Buildings

Activities

Structures

North Arrow

Wells

UIC Systems, septic tanks, UST, piping and other underground structures

Outdoor Hazardous Materials storage and handling areas

Extent of paved areas

Location of environmental samples previously taken with analytical results

Waste management and disposal areas

Property Lines

1.8.3(A)(9) Include a general characterization of the property surrounding the area including, but not limited to:

Location and distance to any surface water bodies within 500 ft of the site.

Location and distance to any Environmentally Sensitive Areas within 500 ft of the site.

Actual sources of potable water for all properties immediately abutting the site.

Location and distance to all public water supplies, which have been active within the previous 2 years and within one mile of the site.

Determination as to whether the Release impacts any off-site area utilized for residential or industrial/commercial property or both.

Determination of the underlying groundwater classification and if the classification is GB, the distance to the nearest GA area.

1.8.3(A)(10) Include classifications of surface and ground water at and surrounding the site that could be impacted by a Release.

1.8.3(A)(11) Include a description of the contamination from the Release, including:

Free liquids on the surface

LNAPL and DNAPL

Concentrations of Hazardous Substances which can be shown to present an actual or potential threat to human health and any concentrations in excess of any of the remedial objectives (reference Section 1.13)

Impact to Environmentally Sensitive Areas

Contamination of man-made structures

Odors or stained soil

Stressed vegetation

Presence of excavated or stockpiled material and an estimate of its total volume

Environmental sampling locations, procedures and copies of the results of any analytical testing at the site

List of Hazardous Substances at the site

Discuss if the contamination falls outside of the jurisdiction of the Remediation Regulations, including but not limited to USTs, UICs, and wetlands.

1.8.3(A)(12) Include the concentration gradients of Hazardous Substances throughout the site for each media impacted by the Release.

- 1.8.3(A)(13) Include the methodology and results of any investigation conducted to determine background concentrations of Hazardous Substances identified at the Contaminated-Site (see Section 1.13).
- 1.8.3(A)(14) Include a listing and evaluation of the site specific hydrogeological properties which could influence the migration of Hazardous Substances throughout and away from the site, including but not limited to, where appropriate:
- Depth to GW
 - Presence and effects of both the natural and man-made barriers to and conduits for contaminant migration
 - Characterization of bedrock
 - Groundwater contours, flow rates and gradients throughout the site
- 1.8.3(A)(15) Include a characterization of the topography, surface water and run-off flow patterns, including the flooding potential, of the site.
- 1.8.3(A)(16) Include the potential for Hazardous Substances from the site to volatilize and any and all potential impacts of the volatilization to structures within the site.
- 1.8.3(A)(17) Include the potential for entrainment of Hazardous Substances from the site by wind or erosion actions.
- 1.8.3(A)(18) Include detailed protocols for all fate and transport models used in the Site Investigation.
- 1.8.3(A)(19) Include a complete list of all samples taken, the location of all samples, parameters tested for and analytical methods used during the Site Investigation. (Be sure to include the samples locations and analytical results on a site figure).
- 1.8.3(A)(20) Include construction plans and development procedures for all monitoring wells. Well construction shall be consistent with the requirements of the Groundwater Quality Rules.
- 1.8.3(A)(21) Include procedures for the handling, storage and disposal of wastes derived from and during the investigation.

1.8.3(A)(22) Include a quality assurance and quality control evaluation summary report for sample handling and analytical procedures, including, but not limited to, chain-of-custody procedures and sample preservation techniques.

1.8.3(A)(23) Include any other site-specific factor, that the Director believes, is necessary to make an accurate decision as to the appropriate Remedial Action to be taken at the site.

1.8.4 Include Remedial Alternatives. The Site Investigation Report shall contain a minimum of **TWO (2)** remedial alternatives other than no action/natural attenuation alternative, unless this requirement is waived by the Department. It should be clear which of these alternatives is most preferable. All alternatives shall be supported by relevant data contained in the Site Investigation Report and consistent with the current and reasonably foreseeable land usage, and documentation of the following:

- Compliance with Section 1.9 (RISK MANGEMENT);
- Technical feasibility of the preferred remedial alternative;
- Compliance with federal, state and local laws or other public concerns; and
- The ability of the Performing Party to perform the preferred remedial alternative.

1.8.5 **Certification Requirements:** The Site Investigation Report and all associated progress reports shall include the following statements signed by an authorized representative of the party specified:

A statement signed by an authorized representative of the Person who prepared the Site Investigation Report certifying the completeness and accuracy of the information contained in that report to the best of their knowledge; and

A statement signed by the Performing Party responsible for the submittal of the Site Investigation Report certifying that the report is a complete and accurate representation of the site and the Release and contains all known facts surrounding the Release to the best of their knowledge.

1.8.6 **Progress Reports:** If the Site Investigation is not complete, include a schedule for the submission of periodic progress reports on the status of the investigation and interim reports on any milestones achieved in the project.

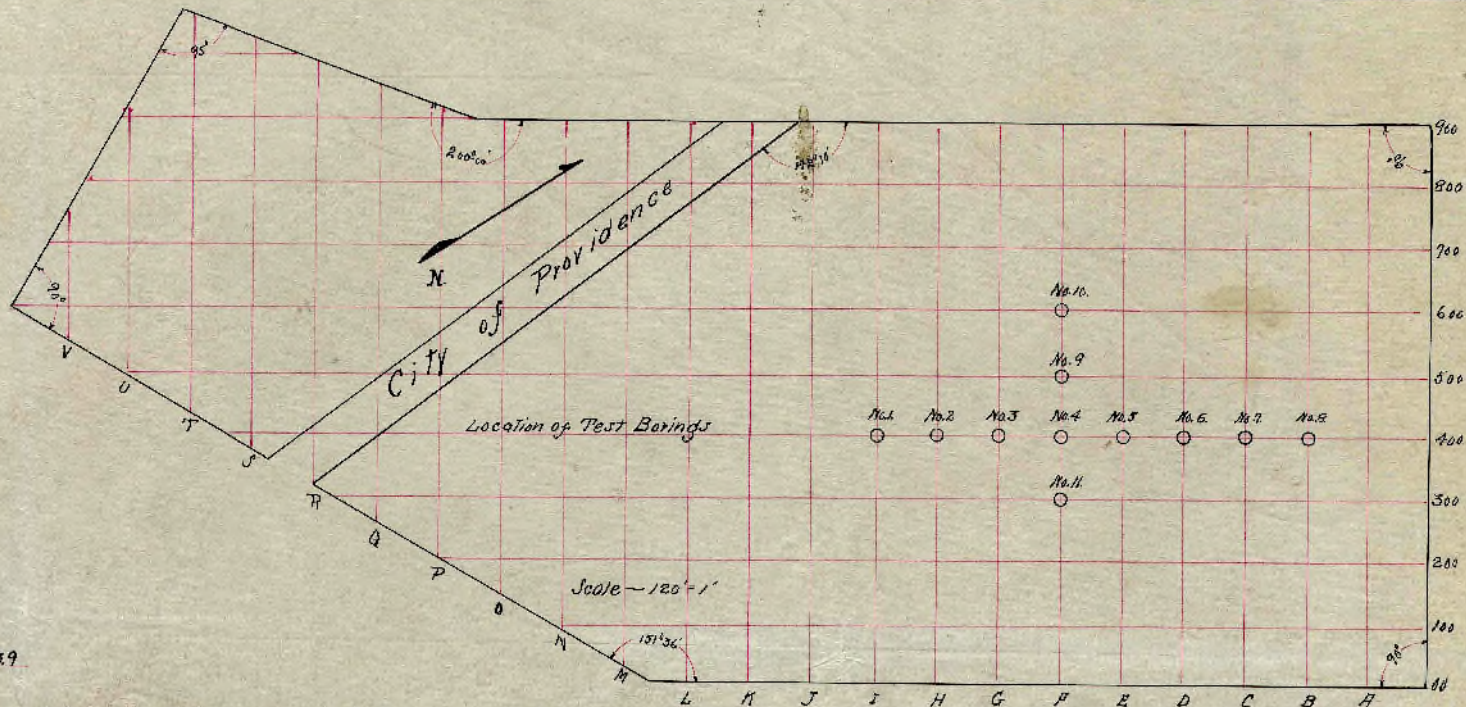

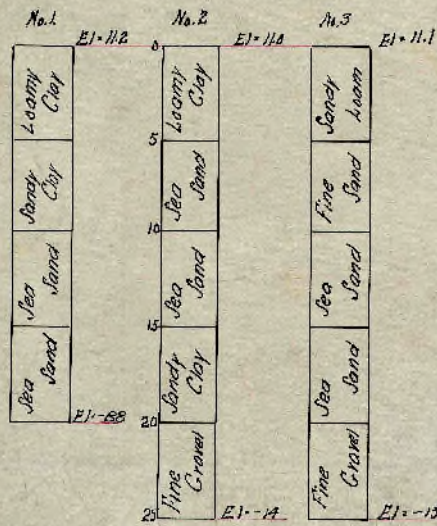

Public Involvement and Notice: Be prepared to implement public notice requirements per Sections 1.8.7 and 1.8.9 of the Remediation Regulations when the Department deems the Site Investigation Report to be complete.

Indicate if the site falls within an Environmental Justice (EJ) area and, if applicable, include all EJ public notice documentation issued, and the list of recipients.

|-----------|------------|--------|-----|-----------------------|-------------|------------|---|
| | | Type | No. | | | | |
| 9.7 | 0 | | | | | SP-SM | Posthole to 4'. FILL: Gravelly sand, mostly fine, 10-20% subangular to subrounded gravel to 2 1/2" (some coke), 5-10% nonplastic fines, moist, dark brown, hydrocarbon odor. |
| | 5 | S | 1 | 2-3-2-2 (17.0") | 5 | SP-SM | S-1: Sand, fine to medium, mostly fine, 5-15% slightly plastic fines in pockets, light olive, some black staining, saturated with oil. |
| | | S | 2 | 3-4-8-15 (20.0") | 12 | SP-SM | S-2: Sand, fine to medium, mostly medium, 5-10% slightly plastic fines (mainly in 1-2" pockets), medium dense, mottled (light olive and black), saturated with oil, strong hydrocarbon odor. |
| | | S | 3 | 5-6-11-12 (18.0") | 17 | SP-SM | S-3: Similar to S-2, except 1 shell. |
| | 10 | S | 4 | 5-7-8-9 (22.0") | 15 | SP-SM | S-4: Gravelly sand, coarse to fine, mostly medium to fine, 10-20% subrounded to rounded gravel to 1", 5-10% nonplastic fines, medium dense, wet, light olive with black mottling, hydrocarbon odor. |
| | | S | 5 | 4-6-8-8 (17.0") | 14 | SP | S-5: Sand, poorly graded, coarse to fine, mostly medium to fine, 5-15% subrounded gravel to 1 1/4", <10% nonplastic fines, medium dense, wet, olive gray, slight hydrocarbon odor. |
| | 15 | S | 6 | 0-1-2-1 (9.0") | 3 | SP OL | S-6A (Top 4"): Similar to S-5. S-6B (Bot. 5"): Organic silt, moderately plastic, 5-10% fine to medium sand, soft, moist, brownish gray, hydrocarbon odor. |
| | | S | 7 | 0-1-1-1 | 2 | OL | S-7: Similar to S-6B, except pockets of dark gray, medium to fine sand. |
| | 20 | U | 1 | PUSH (19.0") | | OL | U-1: Organic silt, slightly plastic, 5-10% fine to medium sand, moist, dark olive, shells. |
| | | S | 8 | 0-1-1-1 (18.0") | 2 | OL | S-8: Organic silt, slightly plastic, 5-15% coarse to fine sand, mostly fine sand, very soft to soft, moist, brownish gray, trace organic fibers. |

Legend/Notes

- Datum is NGVD 1929.
- ∇ indicates groundwater level.
- █ indicates location of samples.
- Blows = number of blows required to drive 2" O.D. sample spoon 6" or distance shown using 140 pound hammer falling 30".
- () = inches of sample recovery.
- Recovery = % rock core recovery.
- RQD = Rock Quality Designation.
- SPT N = Standard Penetration Test resistance to driving, blows/ft.
- USC = Unified Soil Classification system.
- * indicates use of 300 pound hammer.

Sample Type:

- S = Standard split-spoon
- U = Undisturbed tube

BORING LOG

Boring SWBL-15
J.O. 05885.20
Sheet 1 of 2

Site: Fields Point, Providence, RI

Logged by: A.C. Smith

Client: Algonquin LNG, Inc.

Date Start - Finish: 10/19/95 - 10/19/95

Coordinates: N 219.53 W 949.26

Ground Elevation: 12.089 ft

Groundwater Depth:

Depth to Bedrock:

Total Depth Drilled: 52 ft

Contractor: American Drilling

Driller: R. Leger

Rig Type: CME-75

Methods:

Casing Used: None

Drilling Soil: 4.25" hollow-stem augers

Sampling Soil: Standard split-spoon sampler driven using a CME automatic SPT hammer

Drilling Rock: None

Comments: Groundwater depth as noted during drilling.

REMARKS:
 10. Possible boulder encountered while driving casing. Wash ahead from approximately 77' to 80'.
 11. Sand blew up into rods, after 5-20 collected and began to wash ahead.
 12. 4-9-04 finish cleaning blown in sands and wash ahead to 85' casing installed to 85'. Boulders encountered.
 13. Rollerbit ahead and wash out to 100'.
 14. After S-22 casing driven to 95'. Rollerbit ahead. Losing water at 105' during washout. Tough drilling at 108'.
 Drive casing to 103'.

REMARKS:
 7. Use mud to keep hole open after S-32.
 8. Sand blew into casing approximately ±8'.
 9. Drillers removed 5" casing and installed 3" casing, mud added.
 10. Possible boulder encountered, difficult drilling.

NOTES:

REMARKS

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a MiniRae 3000 Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicated readings below the instruments detection limit of 0.1 ppmv. N/A= Not Applicable, NM=Not Measured, bgs=below ground surface, WOH=Weight of Hammer

2 - 2" crushed stone at the surface.

3 - Possible groundwater table encountered at 9 feet bgs.

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. 2. The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring. 3 - Water table was observed at 6 feet bgs during drilling. 4. A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 14 feet bgs, 2" Diameter, Schedule 40, flush joint, PVC Riser installed from 0-4 feet bgs. Filter Sand placed in annulus from 3-15 feet bgs. Bentonite Seals installed from 2-3 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a stand pipe.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. 2. The upper 4 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 3 - Water table was observed at 4 feet bgs during drilling. 4. A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 12 feet bgs, 2" Diameter, Schedule 40, flush joint, PVC Riser installed from 0-2 feet bgs. Filter Sand placed in annulus from 1-13 feet bgs. Bentonite Seals installed from 0.5-1 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a stand pipe.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv.

2 - The upper 5 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.

3 - Water table was observed at 5 feet bgs during drilling.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - Vacuum excavate to 5' below grade before sampling. Top 5' consists of fine to medium sand and gravel (fill).

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

| 60 | | | | | | | | | | | | | |

REMARKS

See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

- 1 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 6.5 feet bgs on 6/3/19.
- 2 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.
- 3 - Drilled through expected boulder between 8 and 9 feet bgs.
- 4 - Casing refusal, obstruction encountered at 22.5 feet bgs. Drive shoe broke off casing and was abandoned at the bottom of the borehole. PRV-1 was terminated and relocated, see PRV-1A.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

- 1 - Test boring PRV-1A offset 15' west from PRV-1 due to obstruction encountered at PRV-1.
- 2 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 6 feet bgs on 7/23/19.
- 3 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.
- 4 - Timber fragments observed in drill fluid between 9 and 22 feet bgs.
- 5 - Drilled to 22 feet bgs and began sampling at PRV-1 termination depth.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 8 - 4-inch casing driven to 104 feet bgs. Driller proceeded with 3-inch casing.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

- 1 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 5.5 feet bgs on 6/3/19.
- 2 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.
- 3 - Sample S-7 obtained using a 3-inch split spoon.
- 4 - 5-inch casing driven to 29 feet bgs. Driller proceeded with 4-inch casing.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
5 - 4-inch casing driven to 89 feet bgs. Driller proceeded with 3-inch casing.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
6 - Sample S-29 taken at 118 feet bgs due to stick up height of casing resulting from telescoping casing. Driller proceeded to drive all casing to a stick-up height of 1.5 feet after taking sample S-29.
7 - Approximately 9 inches of stick-up observed on split spoon after flushing casing at 119 feet bgs due to blowing sands.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

- 1 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 6 feet bgs on 6/3/19.
- 2 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.
- 3 - Gravel observed in spoon tip of samples S-7 and S-8.
- 4 - No recovery for sample S-11. Driller pushed a 3-inch spoon to obtain sample for 18 feet to 20 feet bgs.
- 5 - Drilled through an expected boulder between 20.5 and 22 feet bgs.
- 6 - Gravel observed in spoon tip of sample S-14. Driller pushed a 3-inch spoon to obtain sample for 24 feet to 26 feet bgs.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 9 - Approximately 3 inches of spoon stick-up observed during sampling 124 feet to 126 feet bgs.
 10 - 4-inch casing spun to 139 feet bgs.
 11 - Driller began using drill mud at 144 feet bgs. Initial blow counts may not be representative of actual conditions.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

| | | | | | | | | | | | GLACIAL OUTWASH | | |

- REMARKS**
- 1 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 6.5 feet bgs on 6/3/19.
 - 2 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.
 - 3 - Sample S-7 contained approximately 12 inches of drill wash. Gravel observed in spoon tip.
 - 4 - Drilled through expected boulder between 16 and 17 feet bgs.
 - 5 - Sample S-9 contained approximately 8 inches of drill wash. Gravel observed in spoon tip.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 6 - 5-inch casing driven to 39 feet bgs. Driller proceeded with 4-inch casing.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 9 - 4-inch casing driven to 99 feet bgs. Driller proceeded with 3-inch casing.
 10 - Sample S-26 contained approximately 10 inches of drill wash.
 11 - Approximately 4 feet of blowing sands encountered during sampling at 114 feet bgs. Driller added drill mud to the tub and flushed casing three times prior to obtaining sample S-28. Sample not indicative of actual conditions. Driller proceeded with 3-inch casing up to 119 feet bgs.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - Boring location was cleared for utilities using an airknife and soil vacuum excavation to 5.5 feet bgs on 6/3/19.
2 - Headspace of samples was field screened with a Mini Rae 3000 PID with a 10.6 eV lamp. Results are in PPM.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

APPENDIX D

SUMMARY OF COMPLETED INVESTIGATIONS (1994 through 2009)

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

Previous investigations have been performed at the Site by various firms dating back to 1994. These Site investigations have been documented in reports submitted to the Rhode Island Department of Environmental Management (RIDEM). Investigations included extensive drilling, test pitting, soil sampling and groundwater sampling. The following presents a summary of each previously completed investigation effort. For further information related to previous Site investigations, please refer to the reports referenced.

- July 1994 *Site Characterization Report* prepared by Resource Controls Associates, Inc. (RCA) on behalf of the Providence Gas Company (PGC)

In April 1994, RCA was retained by PGC to prepare a *Site Characterization Report* for the 642 Allens Avenue Site. The scope of work implemented entailed Site inspections, historical research, environmental evaluations, regulatory file reviews, local reconnaissance, and interviews with PGC personnel. The Site Inspection focused on the Natural Gas Regulation portion of the Site. RCA summarized the Site history, probable contaminants of concern based on site historical operations, current operations, and the results of a site inspection. RCA recommended further environmental investigation of the Site, including sampling and analyses of environmental media, and evaluation of soils, groundwater, and surface water.

The findings of these investigations were presented in the July 1994 *Site Characterization Report* prepared by RCA on behalf of the PGC which was submitted to RIDEM.

- February 1995 *Summary Report – Phase 1A Field Investigations* prepared by RCA on behalf of the PGC

In August 1994, RCA was retained by PGC to conduct site investigations and prepare a Phase IA Field Characterization Investigation for the 642 Allens Avenue Site. PGC notified RIDEM on May 13, 1994 of the possibility that an historical release may have occurred at the Site that could be subject to RIDEM's Site Remediation Regulations. In August 1994, on the basis of the July 1994 *Site Characterization Report's* findings, RCA submitted to RIDEM, a work plan, titled "Work Plan for Field Characterization Investigations," which contained a scope of work for an environmental quality investigation at the Site. The purpose of the Phase IA Field Characterization was to evaluate the Site for evidence of the potential release of hazardous materials and the impact that such release(s) may present to public health, safety, and the environment. Site characterization activities included a detailed inspection of the Algonquin Gas Co. (predecessor of National Grid LNG, Inc. (NGLNG)) and Independent Cement Co. (predecessor of Holcim US, Inc.) operations on the Site. Environmental site investigation performed included geophysical surveys, monitoring well construction, soil borings, test pits, groundwater elevation monitoring, and sampling of soil, sediment, surface water, and groundwater. A total of 14 monitoring wells were installed, 4 surface water locations were sampled, and 9 surficial soil areas were investigated. Laboratory analyses of Site environmental media confirmed the presence of a variety of chemical species that commonly occur at former manufactured gas facilities. These included: total petroleum hydrocarbons (TPH), poly-aromatic hydrocarbons (PAHs), and volatile organic compounds (VOCs) in subsurface soil; TPH and PAHs in sediments; dissolved-phase TPH, PAHs, VOCs, metals, and cyanide in groundwater; metals, cyanide, and poly-chlorinated biphenyls (PCBs) in surficial soil; and metals, VOC, and semi-volatile organic compounds (SVOCs), and cyanide in surface water. No non-aqueous phase liquids (NAPL) was observed in any monitoring wells during the course of the investigation activities. Groundwater data indicated an easterly horizontal direction of groundwater flow, with some tidal influence on groundwater elevations near the shoreline, and little tidal effect in the southern section of the Site. The environmental concerns identified by RCA included occurrences

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

of: 1) PCBs in soil near Compressor Building No. 2; 2) metals related to sandblasting around the former Gasholders and the former propane tank area; 3) dissolved cyanide in groundwater at several wells; and 4) petroleum residuals in the north and east portions of the Site. RCA determined that potential human exposures to oil or hazardous materials identified at the Site are limited to on-site workers and/or transient visitors or trespassers. RCA noted that they had found no evidence of an Imminent Hazard at the Site.

The findings of these investigations were presented in the February 1995 *Summary Report – Phase 1A Field Investigations* prepared by RCA on behalf of the PGC which was submitted to RIDEM.

- June 1996 *Summary Report – Phase 1B Field Investigations* prepared by RCA on behalf of the PGC

RCA was retained by PGC to conduct additional site investigations and prepare a *Summary Report – Phase 1B Field Investigations* for the 642 Allens Avenue Site. The *Summary Report – Phase 1B Field Investigations* was a comprehensive report and looked at data collected by RCA during both phases (1A and 1B). The Phase 1A and 1B site investigation activities included a geophysical investigation, site-wide soil gas investigation, a total of forty-one (41) groundwater monitoring wells, seventeen (17) geotechnical test borings, nineteen (19) geoprobe borings, and thirty-eight (38) test pits. An additional thirteen (13) test borings and eight (8) test pits were also been completed to characterize interior conditions of buried structures. Laboratory analyses of environmental media samples from the Site confirmed the presence of a variety of chemical compounds that commonly occur at former MGPs. These included: TPH, PAHs, VOC and metals in soil; TPH and PAHs in sediments; dissolved-phase TPH, PAH, VOC, metals, and cyanide in groundwater; and metals, VOC, PAH, and cyanide in stormwater and subsurface utility pipelines. Light non-aqueous phase liquids (LNAPL) was observed in monitoring wells and on groundwater exposed during test pitting. LNAPL was most prevalent within three distinct areas of the Site: 1) on the northern shoreline near the former relief gasholder (RCA-4); 2) under the southwestern corner of the liquified natural gas (LNG) dike (RCA-26 and RCA-29); and, 3) just west of the former propane building (RCA-21). The petroleum detected was identified by fingerprinting as a mixture of weathered No. 2 fuel oil and coal tar. RCA observed intermittent sheen on the water surface in the cove area of the Site. RCA determined that potential human exposures to oil or hazardous materials identified at the Site are limited to on-site workers and/or transient visitors or trespassers. RCA noted that the potentially significant contaminant migration pathways identified included groundwater transport through the overburden aquifer, and volatilization of contaminants to air. RCA noted that they had found no evidence of an Imminent Hazard at the Site.

The findings of these investigations were presented in the June 1996 *Summary Report – Phase 1B Field Investigations* prepared by RCA on behalf of the PGC which was submitted to RIDEM.

- December 1998 *Remedial Action Work Plan (RAWP)* prepared by Environmental Science Services, Inc. (ESS) on behalf of the PGC

ESS submitted a *Remedial Action Work Plan (RAWP)* to RIDEM in December 1998. The RAWP presented the remedial strategy for the Site which included source removal and placement of engineered caps in select areas of the Site and established Remedial Objectives for the Site. As part of the RAWP, ESS conducted additional subsurface investigation in September 1998 to further evaluate source material present in the former MGP structures located in the upland area adjacent to the cove. ESS documented the results of this investigation in Appendix A – Additional Historic Structure Investigation of the December 1998 RAWP.

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

This investigation was conducted in September 1998 and included conducting a series of borings in the following historic structures: the former relief gasholder, former filter, former open separating tank, former open cooling tank, the former open tar tank and the former tar and ammonia pit (**Figure 4B** (*Exploration Location Plan – Western Side of the Site*)).

A total of six additional borings were conducted in the former Relief Gasholder in September 1998, RHB-1, RHB-2, RHB-3, RHB-4, RHB-5, and RHB-6. Each boring was conducted to the concrete base of the structure. Structure contents consisted of fine-to coarse-grained sand and gravel with some cobbles. There was no visible evidence of coal tar-like material in any of the split spoon samples collected. Petroleum-like odors were evident in some of the split spoon soil samples collected, and was more prevalent in split spoon samples collected from the apparent water table depth, along the eastern side of the holder base. Headspace field readings ranged from 1.0 parts per million by volume (ppmv) to 186.0 ppmv. Dark stained soil was visible in the split spoon samples collected from RHB-2 (6 to 8 feet), RHB-4 (10 to 12 feet), and RHB-5 (8 to 10 feet). There were no exceedances of the Remedial Objectives applicable to soil located more than 100 feet from shore. ESS concluded that “the porous nature of concrete and the potential for the concrete to be breached due to its age may account for the apparent groundwater infiltration into the foundation base. Based on this information, it is proposed that the Relief Gas Holder 16 base be maintained intact. Since no analysis was conducted to document compliance with surface soil Remedial Objectives, PGC agrees to maintain the concrete cap as an encapsulation for the sand and gravel within the foundation.” This relief holder relieving platform foundation is currently intact at the Site.

Two borings (NF-1 and NF-2) were completed in the former filter structure, two borings were completed in the former open separating tank (SPT-1 and SPT-2), two borings were completed in the former open cooling tank (CT-1 and CT-2), three additional borings (ST-1, ST-2, and ST-4) were completed in the Tar Pit, and three additional borings (TAP-1, TAP-3, and TAP-4) were completed in the Ammonia Pit. Each boring extended to the base of the concrete structure (4 to 10 feet bgs). Varying levels of petroleum and/or coal tar-like visual and olfactory impacts were observed in each of these structures. The contents of these structures were later excavated, and the structures were then cleaned and backfilled with soil which met the Remedial Objectives as part of the 2002 remedial efforts (refer to **Appendix F** (*Summary of Completed Remedial Actions (1995 through 2002)*)). The content within the structures was removed and transported off-site to an approved facility. **Figure 4A** (*Exploration Location Plan – Eastern Side of the Site*) and **Figure 4B**, are intended to present the location of explorations that have been performed at the Site. These figures are not intended to present explorations in areas that have been fully excavated (i.e., borings/samples no longer representative of existing conditions). As such, these explorations are not presented on **Figure 4A** or **Figure 4B**.

The findings of these investigations were presented in the December 1998 *RAWP* prepared by ESS on behalf of the PGC which was submitted to RIDEM.

- October 1999 *Subsurface Investigation and Proposed Remediation* prepared by ESS on behalf of the PGC

ESS performed fifty-nine (59) soil borings between July 12 and July 15, 1999 using a GeoProbe drill rig that “direct-pushed” 4-foot acetate samplers to a total depth of 10 feet. The explorations were all completed within the limits of the LNG facility in advance of the construction of a new electrical generator and associated buildings. Various samples from the surface soils (0-2 feet bgs), subsurface (2-10 feet bgs) and groundwater were collected for field screening and subsequent analysis. Twelve (12) of the fifty-nine (59) boring locations were completed as micro-wells to collect a groundwater sample. A total of fifty-nine (59) surface soil samples and sixty (60) subsurface soil samples were submitted for analysis of PP-13 metals, barium, total iron, total cyanide via EPA Method 335.3, PCBs via EPA Method 8082A, TPH via EPA Method 8100M, VOCs

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

via EPA Method 8260B and SVOCs via EPA Method 8270. A total of twelve (12) groundwater samples were retrieved¹ from the temporary well points for analysis of PP-13 metals, barium, total iron, dissolved cyanide via EPA Method 335.3, VOCs via EPA Method 8260B and SVOCs via EPA Method 8270.

ESS noted that the top 2 feet of soil was observed to consist of fine to medium brown sand and gravel with traces of brick and cinder debris. In general, the subsurface soils were observed to be fine to medium grained brown/gray silty sand and gravel. Several locations had pockets of rust/brown and blue/green colored soils similar to the surface samples. Some soil exhibited a petroleum-like odor just below the observed water table. Soil analytical results were typical of urban fill constituents, with widespread exceedances of the RIDEM Method 1 Industrial Commercial Direct Exposure Criteria (I/C-DEC) and/or GB Leachability Criteria for arsenic and PAHs and more sporadic exceedances of TPH. RIDEM Upper Concentration Limits (UCLs) were not encountered in soil.

Prior to retrieving the groundwater samples, the water level in the wells was determined and the water checked for floating product using oil/water interface probe. Floating product was not encountered by ESS, although sheen was identified on the purged groundwater samples in two locations: 18 and 38. Both locations were proximate to the former tar pit near the former Compressor House No. 1. Groundwater samples were collected as grab samples. Benzene was detected in excess of the RIDEM GB Groundwater Objective (GBGO) in one sample only (38) at a concentration of 1.8 mg/L (compared to the GBGO of 0.14 mg/L).

The findings of these investigations were presented in the October 1999 *Subsurface Investigation and Proposed Remediation Report* prepared by ESS on behalf of the PGC which was submitted to RIDEM.

- November 2002 *Remedial Action Closure Report* prepared by Vanasse Hangen Brustlin, Inc. (VHB) on behalf of the New England Gas Company (NEGC)

VHB submitted a *Remedial Action Closure Report (RACR)* to RIDEM in November 2002. The RACR presented the remedial activities that were completed in portions of the LNG Facility in 2002, which included source removal and installation of engineered caps in select areas of the Site.

In order to minimize the amount of ex-situ soil handling and storage, soils in potential excavation areas were sampled in-situ for waste characterization prior to the start of remedial activities. Test pits were completed in the areas proposed for source removal and samples were collected to characterize the subsurface conditions for waste disposal. Thirty-seven (37) test pits (TP-1 through TP-37) were completed in the LNG area (near the former filters, former open cooling tanks and relief gasholder area) and an additional thirteen (13) test pits (TP- 38 through TP-50) were completed in the former tar and ammonia pit area near former Compressor Building No.1. Samples were submitted for TPH via EPA Method 8100M, RCRA-8 metals, reactive cyanide, reactive sulfide, pH, ignitability, PAHs via EPA Method 8270C, VOCs via EPA Method 8260B, and PCBs via EPA Method 8082A. Soil analytical results were typical of urban fill constituents, with widespread exceedances of the RIDEM Method 1 I/C-DEC and/or GB Leachability Criteria for arsenic and PAHs, and more isolated exceedances of TPH. Several exceedances of the RIDEM UCLs were detected for TPH and naphthalene in soil, however, all of these UCLs were removed as part of the remedial efforts.

¹ The method of collection is unknown, however, it is likely that the samples were collected as grab samples.

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

Samples were collected from test pits advanced in each structure and from a sampling grid to satisfy the disposal facilities sampling requirements. Subsurface samples from test pits were generally collected from 2 feet below the water table. The sampling frequency was approximately one sample per 500 tons of material to be disposed and the samples were analyzed for parameters outlined by the disposal facilities. Sampling results were utilized to guide subsurface soil excavations extents.

As above, **Figure 4A** and **Figure 4B**, are intended to present the location of explorations that have been performed at the Site. These figures are not intended to present explorations in areas that have been fully excavated. As such, many of the pre-characterization test pits are not presented on the **Figure 4A** or **Figure 4B** because they have been fully excavated.

The findings of these investigations were presented in the November 2002 *Remedial Action Closure Report* prepared by VHB on behalf of the NEGC which was submitted to RIDEM.

- April 2003 *Site Investigation Report (SIR)* prepared by VHB on behalf of the NEGC

VHB was retained by NEGC to conduct additional Site investigations and prepare a Site Investigation Report (*SIR*) for the 642 Allens Avenue Site. The *SIR* was a comprehensive report and looked at data collected by VHB and previous consultants, including data collected by ESS in 1999 and 2000, which had not been submitted to RIDEM prior to this *SIR*.

ESS (on behalf of PGC) completed four hundred and thirty-nine (439) geoprobe borings, twenty-two (22) temporary monitoring well points and eighteen (18) test pits. Generally, each geoprobe boring was extended just into the water table (4 to 10 feet bgs). In general, ESS submitted one surface soil sample (0 to 2 feet) and one subsurface (vadose zone) soil sample for analysis from each boring. Surface soil samples were submitted for analysis of SVOCs via EPA Method 8270, TPH via EPA Method 8100M, total cyanide, PP-13 metals, total iron, ammonia (select samples only), VOCs via EPA Method 8260B, and pesticides and PCBs via EPA Method 8082. Subsurface soil samples were submitted for analysis of SVOCs via EPA Method 8270, TPH via EPA Method 8100M, total cyanide, total iron, ammonia (select samples only), VOCs via EPA Method 8260B, and PCBs via EPA Method 8082. Select samples were submitted from the test pits for analysis of SVOCs via EPA Method 8270, TPH via EPA Method 8100M, TPH fingerprint, VOCs via EPA Method 8260B, and PCBs via EPA Method 8082. A grab groundwater sample was submitted from each of the temporary well point for analysis of VOCs via EPA Method 8260B.

VHB (on behalf of the NEGC) installed thirty-eight (38) additional test borings, installed eighteen (18) monitoring well and collected eighteen (18) surface soil samples. Test borings were completed with hollow stem auger drilling techniques. Generally, each boring was extended to a depth of 10-15 feet bgs or refusal. Several borings did not vertically define the extent of impacts. Surface soil samples were submitted for analysis of PAHs via EPA Method 8270C, TPH via EPA Method 8100M (select samples only), VOCs via EPA Method 8260B (select samples only) and select metals (select samples only). Subsurface soil samples were submitted for analysis of PAHs via EPA Method 8270C (select samples only), TPH via EPA Method 8100M (select samples only), and VOCs via EPA Method 8260B (select samples only). VHB collected groundwater samples from the VHB monitoring wells and existing RCA monitoring wells and submitted the samples for analysis of VOCs via EPA Method 8260B. VHB also included NAPL and groundwater gauging results.

Appendix D

Summary of Previously Completed Investigations (1994 through 2009)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

VHB concluded that “site-wide surficial soil impacts and subsurface soil impacts are scattered throughout the Site, but appears to be more prevalent in the former Structure No. 6 area, areas around the Gas Control Building, and areas proximate to the former Gasholder 18. Groundwater impacts appear to be more prevalent in areas down gradient of the Regulator Area, areas proximate to the former Gasholder 18, and the former Structure No. 6.”

VHB recommended a remedial alternative that is comprised of focused excavation of subsurface soils exceeding RIDEM GB Leachability Criteria (where allowable), groundwater monitoring and passive recovery of NAPL, placement of an Environmental Land Use Restriction (ELUR) on the property and limiting personnel from areas of the Site with surficial soil exceedances. VHB also recommended that a Method 3 Risk Assessment be conducted for the entire Site to address the remaining regulatory exceedances.

The findings of these investigations were presented in the April 2003 *SIR* prepared by VHB on behalf of NEGC which was submitted to RIDEM.

- January 2009 *Oxide Box Waste Summary Memo* prepared by VHB on behalf of the Narragansett Electric Company (TNEC) doing business as (dba) National Grid (herein referred to as National Grid)

VHB was retained by National Grid to conduct additional test pits in the oxide box area and prepare a summary memo of their findings. The summary memo was intended to present the findings of this additional investigation and propose a remedial strategy for the oxide box area portion of the Site.

VHB excavated five (5) additional test pits. Three subsurface soil samples were collected and submitted for waste pre-characterization analysis of SVOCs via EPA Method 8270, TPH via EPA Method 8100M, VOCs via EPA Method 8260B, select metals (select samples only), TCLP lead and benzene via EPA Method 1311, reactivity, corrosivity, and total cyanide.

VHB concluded that the test pit activities indicate that the former oxide box structures were previously demolished. Based upon the findings of VHB and previous investigations conducted in the oxide box area, VHB concluded that the surface soils in the oxide box area are impacted with TPH, metals, and PAHs above the RIDEM I/C DEC; subsurface soils in the oxide box area had isolated exceedances of the RIDEM GB Leachability Criteria and very isolated exceedances of the RIDEM UCLs for naphthalene and TPH (B-08 collected from 1 to 2 feet bgs).

VHB concluded that the preferred remedial alternative in the oxide box area is excavation of all surface soil within the oxide box area to a depth of 1 foot bgs, excavation of subsurface soil that exceeds RIDEM GB Leachability Criteria and UCL, followed by placement of an engineered soil cap over the oxide box area.

The findings of these investigations were presented in the January 2009 *Oxide Box Waste Summary Memo* prepared by VHB on behalf of National Grid which was submitted to RIDEM.

APPENDIX E

SUMMARY OF REGULAR GROUNDWATER MONITORING (2003 through 2022)

Appendix E

Summary of Regular Groundwater Monitoring (2003 through 2022)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

Vanasse Hangen Brustlin, Inc. (VHB) (on behalf of the New England Gas Company (NEGC)) implemented a groundwater monitoring program at the Site in 2003. The groundwater monitoring program was briefly described in the December 1998 Remedial Action Work Plan (RAWP) submitted to the Rhode Island Department of Environmental Management (RIDEM).

The most significant groundwater impacts (dissolved phase and observations of non-aqueous liquids (NAPLs)) were observed in areas at the Site generally coincident with areas proximate to former MGP operations and subsurface soil impacts. In these locations, benzene, ethylbenzene, and naphthalene were consistently present at concentrations above the GB Groundwater Objective and measurable NAPL had been recorded. Vinyl chloride has also been detected in few Site wells in areas closest to Allens Avenue in excess of the GB Groundwater Objective. Vinyl chloride is not a Site compound of concern and is likely originating upgradient of the Site. No exceedances have been observed in large areas of the Site, including the eastern portions of the Site along the Providence River and the southeastern portion of the Site proximate to the area occupied by Holcim. Results of groundwater monitoring have generally remained consistent at the Site.

The following presents a summary of groundwater monitoring activities at the Site conducted between 2003 and 2021. For further information related to groundwater monitoring, please refer to the reports referenced.

Appendix E

Summary of Regular Groundwater Monitoring (2003 through 2022)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

- Groundwater Monitoring Program (2003 – 2005)

A groundwater monitoring program was implemented by VHB in 2003. The groundwater monitoring program consisted of gauging and sampling all accessible groundwater monitoring wells at the Site. Forty-one (41) monitoring wells were gauged and sampled: twenty four (24) of the monitoring wells located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (RCA-1, RCA-3, RCA-11, RCA-13, RCA-14, RCA-15, RCA-17, RCA-18, RCA-20, RCA-27, VHB-1, VHB-2, VHB-3, VHB-5, VHB-6, VHB-7, VHB-8, VHB-9, VHB-10, VHB-18, VHB-19, VHB-21, VHB-22 and VHB-23), fourteen (14) were located in the Liquefied Natural Gas (LNG) facility (RCA-5, RCA-6, RCA-22, RCA-28, RCA-29, RCA-32, RCA-33, RCA-34, RCA-36, RCA-38, RCA-39, RCA-40, VHB-13 and VHB-20) and three (3) were located in the Former Holcim Area (RCA-37, VHB-11 and VHB-13). The following recovery wells were gauged: ESS RW-1, ESS RW-2, ESS RW-3, ESS RW-4, ESS RW-5, ESS RW-6, CHES RW-1, CHES RW-2, CHES RW-3, CHES RW-4, and CHES RW-5. Absorbent socks were installed (and replaced if needed) in each recovery well with evidence of NAPL.

Prior to sampling, the monitoring wells were gauged for the presence of NAPL using an electronic oil /water-level interface probe. Static water levels were measured to the nearest 0.01-ft relative to the high-point of the top of the poly-vinyl chloride (PVC) riser pipe. Once water levels were measured, purge volumes were calculated for each monitoring well. VHB purged the wells of at least three water volumes using dedicated polyethylene bailers. Wells with any evidence of NAPL were not sampled. The groundwater samples were submitted for analysis of volatile organic compounds (VOCs) via EPA Method 8260B. The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

- Groundwater Monitoring Program (2008 – January 2011)

In 2008, VHB altered the groundwater monitoring program. Monitoring wells included in the new sampling program were selected based on their proximity to the Site boundaries, historic detection of NAPL, historic RIDEM GB Groundwater Objective exceedances, and/or proximity to areas recommended for remediation. Seventeen (17) monitoring wells were sampled: one (1) monitoring well in the former Compressed Natural Gas (CNG) Fueling Area (RCA-12), eleven (11) of the monitoring wells located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (RCA-1, RCA-3, RCA-13, VHB-5, VHB-6, VHB-7, VHB-8, VHB-9, VHB-10, VHB-18 and VHB-21), four (4) were located in the LNG facility (RCA-22, RCA-28, RCA-36 and VHB-13) and one (1) was located in the Former Holcim Area (RCA-37). Prior to sampling, the monitoring wells were gauged for the presence of NAPL using an electronic oil/water-level interface probe. If NAPL was observed in a monitoring well, groundwater was not sampled for dissolved phase laboratory analysis protocols. Static water levels were measured to the nearest 0.01-ft relative to the high-point of the top of the PVC riser pipe. Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, oxidation-reduction potential (ORP), and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. The monitoring program also includes gauging all monitoring wells with historic NAPL detections and recovering NAPL if detected.² The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

² Although gauging and recovering wells with historic detections of NAPL was included in monitoring program, it was only conducted during the 2008 event.

Summary of Regular Groundwater Monitoring (2003 through 2022)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

- Groundwater Monitoring Program (July 2011 – 2013)

GZA performed a comprehensive well assessment in July 2011 in advance of the August 2011 sampling round. After well assessment and repair activities, thirty seven (37) operable monitoring wells were located on the Site: eighteen (18) monitoring wells (RCA-1, RCA-3, RCA-11, RCA-13, RCA-14, RCA-15, RCA-17, VHB-1, VHB-3, VHB-6, VHB-7, VHB-8, VHB-10, VHB-18, VHB-21, VHB-22, VHB-23 and Unknown PVC (NG)) in the Natural Gas Regulating facility and nineteen (19) monitoring wells (RCA-5, RCA-6, RCA-20, RCA-21, RCA-22, RCA-28, RCA-29, RCA-32, RCA-33, RCA-34, RCA-36, RCA-38, RCA-39, RCA-40, VHB-13, VHB-20, GZA-104A, GZA-201, and GZA-216) in the LNG facility. Eleven (11) recovery wells were located on Site: two (2) (CHES RW-1 and RW-2) in the Natural Gas Regulating facility and nine (9) (CHES RW-3, RW-4, and RW-5 and ESS RW-1, RW-2, RW-3, RW-4, RW-5, and RW-6) in the LNG facility. No monitoring wells or recovery wells were located on the Holcim occupied section of the property.

The groundwater monitoring program was altered in August 2011 based on the findings of the July 2011 well assessment. The groundwater monitoring program consisted of gauging and NAPL recovery (if detected) on a semi-annual basis and groundwater sampling select monitoring wells on an annual basis. These monitoring wells selected to be sampled on annual basis were selected based on aerial coverage and a review of historic data. Fifteen (15) monitoring wells were sampled: ten (10) of the monitoring wells were located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (RCA-1, RCA-3, RCA-11, RCA-13, VHB-3, VHB-6, VHB-7, VHB-8, VHB-10, and VHB-21) and five (5) were located in the LNG facility (RCA-22, RCA-28, RCA-36, RCA-38 and VHB-13). Unlike previous sampling rounds, groundwater samples were collected from wells with evidence of NAPL. Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, ORP, and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

- Comprehensive Groundwater Monitoring Activities – 2014

The groundwater monitoring program was altered in 2014 because additional site investigations were performed at the Site. The groundwater monitoring program consisted of gauging and NAPL recovery (if detected) in June/July 2014 and October 2014 and groundwater sampling monitoring wells in June/July 2014, at least monthly sheen observations in the cove and monthly LNAPL gauging and recovery results from RCA-21/RW-1³. These monitoring wells selected to be sampled were selected based on aerial coverage, to supplement historic data for the Site Investigation Report (SIR) Addendum and a review of historic data. In addition, all monitoring wells that were installed in 2014 as part of site investigation activities were sampled. Forty (40) monitoring wells were sampled: four (4) monitoring wells were located in Former CNG Fueling Station near Allens Avenue (GZ-301D, GZ-302S, GZ-302D and RCA-12R), twenty-five (25) monitoring wells were located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (GZ-303S, GZ-303D, GZ-304D, GZ-305S, GZ-306, GZ-307S, GZ-308S, GZ-309D, GZ-311D, GZ-312S, GZ-312D, GZ-313D, GZ-318D, GZ-320D, RCA-1, RCA-3, RCA-11, RCA-13, VHB-1, VHB-3, VHB-6, VHB-7, VHB-8R, VHB-10 and VHB-21) and eleven (11) were located in the LNG facility (GZ-314S, GZ-314D, GZ-315D, GZ-319D, RCA-5, RCA-22, RCA-28, RCA-36, RCA-38, VHB-13 and VHB-20). Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, ORP, and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. The following table presents the sampling data completed under this monitoring program, including a summary of major observations:

³ RCA-21 was replaced with RW-1 during the 2014 Site investigation activities.

- Groundwater Monitoring Program (2015 – 2016)

The groundwater monitoring program was altered in 2014 for calendar years 2015 and 2016 because additional site investigations were performed at the Site. The groundwater monitoring program consisted of gauging and NAPL recovery (if detected) on a semi-annual basis, groundwater sampling select monitoring wells on an annual basis, at least monthly sheen observations in the cove and monthly LNAPL gauging and recovery results from RCA-21/RW-1. Twenty one (21) monitoring wells were sampled: two (2) monitoring wells were located in Former CNG Fueling Station near Allens Avenue (GZ-301D and RCA-12R), twelve (12) monitoring wells were located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (GZ-304D, GZ-309D, RCA-1, RCA-3, RCA-11, VHB-1, VHB-3, VHB-6, VHB-7, VHB-8R, VHB-10 and VHB-21) and seven (7) were located in the LNG facility (GZ-314S, GZ-314D, RCA-22, RCA-28, RCA-36, RCA-38 and VHB-13). Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, ORP, and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. In addition, in advance of upcoming facility projects that were started in Fall of 2016, forty-four (44) wells were decommissioned in June 2016: RCA-3, RCA-5, RCA-7, RCA-11, RCA-13, RCA-14, RCA-20, RCA-29, RCA-32, RCA-33, RCA-38, RCA-40, VHB-3, VHB-6, VHB-7, VHB-8R, VHB-10, VHB-13, VHB-18, VHB-21, VHB-22, VHB-23, CHES RW-1, CHES RW-2, CHES RW-3, CHES RW-4, CHES RW-5, RW-1, ESS RW-1, ESS RW-2, U-1, GZ-204, GZ-216, GZ-311D, GZ-312D, GZ-312S, GZ-313D, GZ-314D, GZ-314S, GZ-315D, GZ-318D, GZ-320D, GZ-401, and GZ-403. The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

- Groundwater Monitoring Program (2017-2020)

The groundwater monitoring program was altered for calendar years 2017, 2018, 2019 and 2020 because of the monitoring well decommissioning activities conducted in advance of facility projects. The groundwater monitoring program consisted of gauging and NAPL recovery (if detected) on a semi-annual basis, groundwater sampling select monitoring wells on an annual basis, at least monthly sheen observations in the cove and monthly LNAPL gauging and recovery results of select monitoring wells. Twelve (12) monitoring wells were sampled: two (2) monitoring wells were located in Former CNG Fueling Station near Allens Avenue (GZ-301D and RCA-12R), five (5) monitoring wells were located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (RCA-1, RCA-15, VHB-1, GZ-304D and GZ-309D) and five (5) were located in the LNG facility (RCA-22/RCA-31⁴, RCA-36, VHB-20, GZA-201 and GZ-319D). Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, ORP, and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

| Submittal | Groundwater Monitoring Activities Summarized in Submittal |

- Groundwater Monitoring Program (2021 through 2022)

The groundwater monitoring program was altered for calendar year 2021 because five (5) additional monitoring wells were installed in September 2021 in the Former Gasholder Area at the Site. The groundwater monitoring program consisted of gauging and NAPL recovery (if detected) on a semi-annual basis, groundwater sampling select monitoring wells on an annual basis, at least monthly sheen observations in the cove and monthly LNAPL gauging and recovery results of select monitoring wells. Seventeen (17) monitoring wells were sampled: two (2) monitoring wells were located in Former CNG Fueling Station near Allens Avenue (GZ-301D and RCA-12R), five (5) monitoring wells were located on the western portion of the Site currently occupied by the Natural Gas Regulation facility (RCA-1, RCA-15, VHB-1, GZ-304D and GZ-309D), four (4)⁵ of the new monitoring wells installed in September 2021 (GZ-500S, GZ-500D, GZ-501S and GZ-502S) and five (5) were located in the LNG facility (RCA-22/RCA-31, RCA-36, VHB-20, GZA-201 and GZ-319D). Groundwater samples were collected via low-flow sampling protocol. During purging of the wells, groundwater was monitored for temperature, conductivity, dissolved oxygen, pH, ORP, and turbidity in an effort to obtain stabilization of the field indicator parameters prior to sampling. Groundwater samples were submitted for analysis of VOCs via EPA Method 8260B. The following table presents the sampling rounds completed under this monitoring program, including a summary of major observations:

⁵ Note that GZ-503S did not have enough water present to be able to groundwater sample.

APPENDIX F

SUMMARY OF COMPLETED REMEDIAL ACTIONS (1995 through 2002)

Appendix F

Summary of Completed Remedial Actions (1995 through 2002) 642 Allens Avenue Former Manufactured Gas Plant (MGP) Providence, Rhode Island

Several remedial actions have been completed at the Site and these activities have been documented in reports previously submitted to the Rhode Island Department of Environmental Management (RIDEM). **Figure 6** (*Completed Remedial Activities (1995 to 2020)*) depicts the areas of the Site where remedial activities have been performed and **Figure 7** (*Existing Engineered Controls*) presents the location of installed RIDEM-approved engineered caps (or equivalent). Remedial activities conducted between 1998 and 2002 were completed consistent with the December 1998 RIDEM-approved Remedial Action Work Plan (RAWP) or subsequent modifications. The following presents a summary of each completed remedial activity. For further information, please refer to the reports referenced below.

- February 1995 *Remedial Action Report for Condensate Tank Closure* prepared by Resource Controls Associates, Inc. (RCA) on behalf of the Providence Gas Company (PGC)

As shown on **Figure 4A** (*Exploration Location Plan – Eastern Side of the Site*), Compressor Building No.2 is located on the south-central portion of the Site, north of the Liquefied Natural Gas (LNG) facility and east of the former gasholders. Condensation from the gas handling systems, which contains small amounts of compressor oil was collected and stored in two 10,000-gallon concrete underground storage tanks (USTs) in the building. Initial Site investigations previously performed by RCA indicated that these USTs collectively contained approximately 4,600 gallons of condensate and oil. Poly-chlorinated biphenyls (PCBs) were detected at concentrations up to 280 parts per million (ppm) in these oils.

The completed remedial activities included the closure of two 10,000-gallon USTs formerly used for the accumulation of PCB-impacted oil and water, and limited soil excavation, in compliance with RIDEM-approved closure plans. Soils containing PCBs in excess of 50 ppm were removed from the UST area under Compressor Building No.2, and soils containing PCB concentrations greater than 25 ppm were removed from the vicinity of the exterior remote fill pipes. A total of 25 tons of PCB-impacted soil and debris were shipped for off-Site disposal at Chemical Waste Management facility in Model City, New York. RIDEM issued a Certificate of Closure on December 12, 1995.

The remedial action was documented in the October 1995 *Remedial Action Report for Condensate Tank Closure* prepared by RCA on behalf of PGC which was submitted to RIDEM.

- October 1995 *UST Closure Assessment* prepared by Hoffman Engineering, Inc. (HEI) on behalf of PGC

As shown on **Figure 4A**, two former USTs and a pump dispenser were located in the vicinity of former gasholders Nos. 18 and 21 and the former Holder Heating Building. Each UST was 4,000 gallons in capacity and reportedly stored diesel fuel. UST removal activities were performed on October 5, 1995 and were witnessed by RIDEM. The contractor removed both tanks for disposal off-Site. Both tanks were observed to be in good condition. The contractor excavated approximately two (2) cubic yards (CY) of soil from the area underneath the pump dispenser, until photo-ionization detector (PID) readings were non-detect. RIDEM issued a Certificate of Closure on December 11, 1995.

The remedial action was documented in the October 1995 *UST Closure Assessment* prepared by HEI on behalf of the PGC which was submitted to RIDEM.

Appendix F

Summary of Completed Remedial Actions (1995 through 2002)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

- June 1996 *Remedial Action Report for Short Term Measure Performed at the Providence Gas Company* prepared by RCA on behalf of PGC

RCA conducted a short term remedial action in the LNG area in April 1996. A ten-inch diameter pipe was exposed at the northeast corner of the Site proximate to the former open cooling tank during implementation of their test pit program in February and March 1996. It appeared that the pipe may have been acting as a preferential pathway for potential oil migration. As such, the most appropriate action appeared to be removal of the pipe, where accessible, and sealing the remainder of the pipe with concrete slurry.

Approximately 85 feet of a 10-inch diameter steel pipe was removed from a point where it entered the former open cooling tank, south along to the former open separating tank to where it was ultimately sealed with a concrete slurry proximate to a gas line located under the northern access road. During excavations along the edge of the former open separating tank, a second 10-inch diameter pipe was discovered that was also oriented in a north to south direction. Sections of this pipe were also removed with the remaining sections sealed with a concrete slurry.

The deeper portions of the trenches that were excavated during the pipe removal were backfilled with Site. Clean fill was used to bring the trench areas back to grade.¹

The remedial action was documented in the June 1996 *Remedial Action Report for Short Term Measure Performed at the Providence Gas Company* prepared by RCA on behalf of PGC which was submitted to RIDEM.

- September 1998 *UST Closure Assessment* prepared by HEI on behalf of PGC

As shown on **Figure 4B** (*Exploration Location Plan – Western Side of the Site*), a former UST was located inside former Compressor House No.2. The UST was approximately 2,500 gallons in capacity and reportedly stored diesel fuel utilized to power compressors located in the building. On August 11, 1998, the UST was pumped out and filled in place using concrete flow fill. One (1) drum of sludge was removed from the bottom of the tank and disposed of off-Site at United Oil Recovery Inc., in Meriden, Connecticut. The tank was observed to be in good condition. All piping was removed from the tank. No visual or olfactory evidence of impacts were noted. A groundwater sample was collected from the two nearby monitoring wells and submitted for analysis of total petroleum hydrocarbons (TPH) and poly-aromatic hydrocarbons (PAHs). PAHs were not detected in either sample. TPH was detected at concentrations of 200 and 350 µg/L. RIDEM issued a Certificate of Closure on January 12, 1999.

The remedial action was documented in the October 1995 *UST Closure Assessment* prepared by HEI on behalf of the PGC which was submitted to RIDEM.

- October 1999 *Subsurface Investigation and Proposed Remediation* prepared by Environmental Science Services, Inc. (ESS) on behalf of PGC

In preparation for a proposed generator construction project at the LNG facility, ESS conducted a subsurface investigation in July 1999 and subsequent remedial actions in August 1999. The remedial action was completed in accordance with protocols set forth in the December 1998 RAWP. A 30-foot square grid approximately 330 feet long by 150 feet wide was established north of the storage building and south of the dike, resulting in the completion of fifty-

¹ It should be noted that the soil and piping was later removed during the remedial activities conducted by Clean Harbors Environmental Services, Inc. (CHES) and Vanasse Hangen Brustlin, Inc. (VHB) during the summer of 2002.

Appendix F

Summary of Completed Remedial Actions (1995 through 2002)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

seven (57) borings with twelve (12) borings completed with temporary groundwater sampling points. Investigation performed under this effort is presented in Section 2.8 and **Appendix D** (*Summary of Previously Completed Investigations (1994 through 2009)*).

Based on laboratory analysis of the soil samples, a remedy was proposed and implemented consisting of focused excavation, off-site transport and disposal of excavated soil, and installation of engineered caps. Surficial soil removals were conducted to excavate 1 foot of impacted soil in areas that were not proposed to receive 2 feet of clean fill, backfilled with clean material, and paved with two, 4-inch lifts of asphalt. The remaining areas were not excavated, but were encapsulated with 2 feet of clean fill or asphalt or concrete.² ESS noted that the backfill analytical results conformed to the RIDEM-approved Remedial Objectives established in the RAWP. However, the analytical data for the backfill used in a portion of the generator area reveals that it was impacted with arsenic and PAHs that exceed the RIDEM Method 1 Residential Direct Exposure Criteria (RDEC). According to the 1999 *Subsurface Investigation and Proposed Remediation report*, ESS discussed the presence of these compounds with RIDEM. Since this backfill complied with the RAWP Remedial Objectives, and the area would eventually be subject to an ELUR, RIDEM reportedly indicated that they would allow the backfill to remain.

Upon completion of excavation, and prior to backfilling the area, ESS performed verification sampling across the remediated area. Verification sampling was performed along the western, southern and eastern sides of the excavation at 15-foot intervals between sample points where previously-impacted soils were identified. The verification samples were only analyzed for the constituent that exceeded the objectives in the original investigation. Several verification samples were detected in excess of the RIDEM-approved Remedial Objectives for arsenic and PAHs, however, additional excavation was not required because the area was finished with a RIDEM compliant engineered cap.

The remedial action was documented in the October 1999 *Subsurface Investigation and Proposed Remediation* prepared by ESS on behalf of PGC which was submitted to RIDEM.

- May 2001 *Compressor Building No. 2 PCB Remediation Summary Letter* prepared by ESS on behalf of PGC

In August 2000, CHES hand excavated an area of PCB-impacted soils located between the existing paved access road and Compressor Building No. 2 under the supervision of PGC. The overall extent of excavation was limited due to the presence of active natural gas distribution lines. The horizontal extent of the excavation was the asphalt road to the north, concrete sidewalk to the east, and estimated locations of unaffected soil to the west and south. The vertical extent of the excavation was the top of the groundwater table, encountered at approximately eight (8) feet below grade. According to CHES work order slips, approximately 17 cubic yards of soil was excavated.

On August 3, 2000, ESS personnel collected confirmatory samples from the sidewalls and bottom of the excavation. According to PGC, after the laboratory analytical results were reported, it was realized that additional samples needed to be collected to determine an upper confidence limit. ESS collected these additional bottom samples on August 23, 2000. Based on the results of confirmatory bottom samples, additional soil excavations were completed by CHES in two adjacent grids. Soil was removed approximately one foot into the groundwater table. Approximately an additional 17 cubic yards of soil

² During this remedial work, an ethylene glycol spill occurred at the West Compressor Area on August 25, 1999. Notification was made to RIDEM on August 26, 1999. Approximately 40 CY of soil was excavated, the area was backfilled and the excavated soil was reportedly disposed of properly.

Appendix F

Summary of Completed Remedial Actions (1995 through 2002)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

was removed from the excavation. Total PCBs were detected in the bottom samples collected one foot below the water table at concentrations ranging from non-detect (ND) to 26.15 mg/kg.

The excavated soil was loaded onto three licensed vehicles on September 14, 2000 and transported to the licensed Chemical Waste Management facility in Model City, New York on Hazardous Waste manifests NYB7886376, NYB7886385, and NYB7886403.

The excavation was backfilled with soil in compliance with the Remedial Objectives approved by RIDEM in the December 1998 RAWP.

The remedial action was documented in the May 3, 2001 *Compressor Building No. 2 PCB Remediation Summary Letter* prepared by ESS on behalf of PGC which was submitted to RIDEM.

- January 2001 *Remediation of the New Regulator Area*³

In 1999, during the remedial activities approved by RIDEM in the 1998 RAWP, PGC planned to construct natural gas related equipment and piping in the area designated as the Natural Gas Regulation Facility. This gas regulator station is located north of the former Meter House and contains various sizes of natural gas pipes both below and above ground. The equipment upgrade design included excavating trenches for new in-ground piping, as well as three concrete slabs.

On December 20, 1999, PGC submitted a letter to RIDEM seeking approval to start remedial activities in the Natural Gas Regulation Facility (**Figure 4A**). According to the letter, the Natural Gas Regulation Facility was approximately defined by borings D01 through D15; as shown on **Figure 4A**. Laboratory analytical results of surficial soil (0-2 feet bgs) samples collected from this area indicated arsenic, lead, and benzo (a) pyrene concentrations that exceeded the 1998 RAWP surficial soil Remedial Objectives in soil borings D03, D04, D07, D08, D10, D13, D14, and D15. There were no compounds detected in the subsurface soil samples that exceeded the RAWP subsurface soil Remedial Objectives.

To remediate the area prior to construction, PGC proposed excavating all of the surface and subsurface soil to the groundwater interface within the limits of the proposed regulator station construction. Since there were a large number of subsurface utility pipes in the area, PGC proposed leaving the soil in place below the piping so that the integrity of the piping could be maintained. Since remedial soil excavations were already being conducted in other areas of the Site under the 1998 RAWP (see Section 2.8), excavated soils from the 642 Allens Avenue regulator station were proposed to be managed on Site in the same manner. The excavation was proposed to be backfilled with clean fill (meeting the Remedial Objectives) and any areas that did not receive two feet of fill were covered with two, 2-inch lifts of asphalt.

The work plan for this area was approved by RIDEM in a letter to PGC dated March 16, 2000. Additionally, RIDEM Office of Air Resources (OAR) was notified of the proposed remediation and no permits were required based on correspondence dated February 14, 2000 from RIDEM OAR to ESS. Soils from the excavation were staged on Site for future disposal with other non-hazardous waste soils. Additionally, any inactive piping larger than 2 inches in diameter uncovered during excavations activities was removed and properly disposed in accordance with the RAWP.

³ Note that this remedial activity was summarized by VHB on behalf of the New England Gas Company (NEGC) in the April 2003 *Site Investigation Report (SIR)*. GZA has not been able to find any other documentation of this remedial activity.

Appendix F

Summary of Completed Remedial Actions (1995 through 2002) 642 Allens Avenue Former Manufactured Gas Plant (MGP) Providence, Rhode Island

During the excavation activities, a small natural gas pipeline sump that formerly collected condensate was uncovered. This sump was located below the grade of the excavation and contained a small amount of water. RIDEM was consulted and the decision to remove the sump without further investigation was approved.

Verification sampling was performed within the excavation at 15 foot intervals along the bottom and sidewalls in accordance with the RAWP requirements. The excavation was backfilled to grade with a minimum of two feet of soil which met the Remedial Objectives in preparation for the new equipment installation; refer to **Figure 7**. A total of 1,200 cubic yards of soil was removed from the area for management on-Site.

The remedial action was documented in the April 2003 Site Investigation Report prepared by VHB on behalf of the New England Gas Company (NEGC) which was submitted to RIDEM.

- November 2002 *Remedial Action Closure Report* prepared by VHB on behalf of NEGC

VHB supervised remedial actions at a portion of Site from May 2002 to October 2002, pursuant to the RIDEM Temporary Remedial Action Permit (TRAP) issued by RIDEM on April 17, 2002. CHES of Weymouth, MA was the contractor providing the remediation/construction services and ENSR International (ENSR) of Westford, MA provided oversight services on behalf of New England Gas Company (NEGC). The scope of work for this remedial action consisted of installing a containment boom in the cove, excavating MGP impacted materials from within former MGP structures and/or impacted areas of the Site, performing stabilization and transportation of materials to an appropriate licensed out-of-state facility for treatment/disposal and backfill with soils meeting Remedial Objectives. The areas of material removal included six areas located primarily along the northern portion of the Site adjacent to the cove (refer to **Figure 4B**) and included the following:

- Former Tar and Ammonia Pits;
- Former Filters;
- Former Open Cooling Tank;
- Former Open Separating Tank;
- Former Open Tar Tank; and
- Light Non-Aqueous Phase Liquids (LNAPL) seep area along the cove area adjacent to the riverbank.

A containment boom was installed at the Site (see configuration on **Figure 2B** (*Existing Conditions Plan – Western Side of the Site*)) in the cove prior to any remedial work in this area.

Remedial soil excavations were guided by analytical data from soil samples collected from previous borings completed by ESS within Former Compressor Building No.1 and other historical Site investigation data (see Section 2.8 and **Appendix D** for information about historical site investigation activities at the Site).

The contents of the above-referenced structures generally consisted of coal tar sludges that were stabilized within each structure using a combination of soil, hydrated lime, and/or absorbent material. Once stabilized, the material was direct loaded, when feasible, for transport to one of three treatment/disposal facilities as described below.

Appendix F

Summary of Completed Remedial Actions (1995 through 2002)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

Impacted soils were also excavated from the area surrounding the structures and were either transported for treatment/disposal, used to stabilize structure contents prior to direct loading, used as backfill if the corresponding Remedial Objectives were not exceeded, or stored in the on-Site stockpile for use as subsurface backfill during future phases of the project. Subsequent to excavation activities, confirmatory soil samples were collected from excavation sidewalls and from the excavation floor (if the excavation did not extend into the ground water table) and compared to the 1998 RAWP Remedial Objectives to determine compliance.

Historic observations of sheening in the Providence River created concerns that there was a LNAPL seep area along the cove area adjacent to the riverbank. The natural gas pipeline located under the northern access road was shut down and a section removed to facilitate excavations within the LNAPL seep area. Upon completion of the remediation excavation, the natural gas pipeline was replaced with new pipe and put back into service. MGP-impacted soil in this area was excavated in an approximate area of 25 feet wide by 100 feet in length between Former Relief Gasholder No.16 and Former Open Cooling Tank and removed to a depth of 2 feet into the water table. Piping observed in this area was removed when possible; pipe that could not be removed was sealed with hydraulic cement.

A total of approximately 16,864 tons of MGP-impacted material was excavated, transported and treated/disposed of during the 2002 remedial activities. Approximately 9,558 tons was classified as hazardous and approximately 7,307 tons was classified as non-hazardous. The MGP-impacted material was shipped to one of three licensed receiving facilities: Keystone Sanitary Landfill (Keystone) in Dunmore, Pennsylvania; Environmental Soil Management, Inc. (ESMI) in Loudon, New Hampshire; and Chemical Waste Management, Inc. (WM Emelle) in Emelle, Alabama.

Recovery wells were installed to aid in the recovery of LNAPL from the groundwater surface in areas of subsurface soil excavations (CHES RW-1 to CHES RW-5). All soil excavations and excavated structures were backfilled with soil meeting the Remedial Objectives. The areas of the Site that were remediated under this work were completed with RIDEM-approved engineered caps (at least 2 feet of soil which met the Remedial Objectives, crushed stone asphalt, concrete or building); refer to **Figure 7**.

The remedial action was documented in the November 2002 *Remedial Action Closure Report* prepared by VHB on behalf of NEGEC which was submitted to RIDEM.

- December 2002 *Remedial Action Closure Report* prepared by VHB on behalf of NEGEC

ESS supervised remedial actions at a portion of the Site beginning in June 1999 in accordance with the RIDEM issued June 1, 1999 TRAP. The remedial activities were conducted to address a portion of the Site in the LNG Facility. These activities were of a time-critical nature due to the proposed construction of a vaporizer pad in the southwestern portion of the LNG facility adjacent to the containment dike. To construct the pad, surface soil was excavated and subsurface piping which traversed the area was removed.

During the remedial action, soil was excavated and disposed to allow for installation of the new vaporizer pad. The excavations were guided by test pit and soil boring data from previously completed RCA investigations (as presented in Section 2.8 and **Appendix D**). Excavation was generally conducted at least 2 feet into the water table. All MGP remnant piping was either removed or sealed with hydraulic cement.

Recovery wells (ESS RW-1 to ESS RW-6) were installed to aid in the recovery of LNAPL from the groundwater surface in areas of subsurface soil excavations. Areas that were excavated were capped with approximately 2 feet of clean fill meeting the Remedial Objectives or were covered by structures (vaporizer pad).

Appendix F

Summary of Completed Remedial Actions (1995 through 2002)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

Additional remedial activities consisted of the removal of the contents of the former tar and ammonia pits to the extent practical (located proximate to the former Compressor House No.1; **Figure 4B**). Portions of the former tar and ammonia tank were not structurally accessible due to the presence of the LNG containment dike. Approximately 50,800 gallons of coal tar was removed from the former tar and ammonia pits and shipped to the Norlite Corporation facility in Cohoes, NY for disposal.

A total of approximately 8,746 tons of MGP-impacted material was excavated, transported and disposed of during remedial activities. Approximately 722 tons was classified as hazardous and approximately 8,024 tons was classified as nonhazardous. According to correspondence from ESS to RIDEM, dated July 19, 2000, surface soil that did not meet the criteria for backfill and subsurface soil that was not classified as hazardous was shipped to Environmental Soil Management, Inc. (ESMI) in Loudon, NH. Hazardous waste soils were transported to Horizon Environmental Landfill in Grande-Piles, Quebec, Canada. The requirements for the export of hazardous waste, including the Notification of Export to the United States Environmental Protection Agency (USEPA), were met according to a letter dated July 24, 2000 from the USEPA (EPA Notice No. 435/00).

Approximately 9,782 gallons of water and LNAPL was pumped from excavations utilizing vacuum trucks from Cyn Environmental Services. The water and LNAPL was disposed of at Cyn Environmental Service's Stoughton, MA recycling facility.

All excavations were backfilled with soil meeting the Remedial Objectives. The areas of the Site that were remediated under this work were completed with RIDEM-approved engineered caps (at least 2 feet of soil meeting the Remedial Objectives, crushed stone, asphalt, concrete or building); refer to **Figure 7**.

The remedial action was documented in the December 2002 *Remedial Action Closure Report* prepared by VHB on behalf of NEGC which was submitted to RIDEM.

APPENDIX G

SUMMARY OF EARTHWORK ACTIVITIES conducted under the September 2012 Soil Management Plan (SMP) (October 2012 through December 2022)

Appendix G

Summary of Earthwork Activities conducted under the September 2012
Soil Management Plan (SMP) (October 2012 through April 2022)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

A Soil Management Plan (SMP) was established for the Site and submitted to RIDEM on September 12, 2012. The SMP was prepared to establish procedures that will be followed should construction or utility maintenance activities at the Property require the need to manage soils excavated from the subsurface. The SMP established procedures for soil screening/disposal requirements, soil stockpile management and erosion controls, odor controls, dust controls, capping requirements, decontamination protocols equipment leaving the Site, requirements for import of soils, basic dewatering guidelines and management of non-soils (such as asphalt or concrete). The SMP is similar to what would be recorded with an Environmental Land Usage Restriction (ELUR) and has been utilized at the Site for numerous small facility projects (such as fence post installation, geotechnical investigation work, utility emergency work, smaller facility projects under previously installed engineered caps, and other critical utility infrastructure work)¹.

In accordance with the SMP, The Narragansett Electric Company (TNEC) or GZA notified the RIDEM Office of Land Revitalization and Sustainable Materials Management (OLRSMM) prior to initiation of intrusive activities for each of the projects described below, with the exception of emergency repairs.

Since the SMP was established, TNEC has completed several smaller projects onsite following the SMP; these projects are summarized in the table below. For each of these projects, a representative from GZA was onsite during intrusive activities to perform perimeter air monitoring as needed, and to oversee compliance with the requirements of the SMP. The perimeter air monitoring program for these projects generally consisted of collection of periodic measurements upwind and downwind of the work zone for TVOCs using a MiniRAE Model 3000 Photo-Ionization Detector (PID) and Respirable Dust (PM₁₀) Levels employing a DustTrak dust meter. TVOC and PM₁₀ readings were measured at the perimeter of the Project area approximately every two hours during each day or more frequently depending on field conditions (at least four times a day). The thresholds for the perimeter air monitoring program were sustained readings (readings lasting 5 minutes) of 1.0 ppmv for TVOCs and 150 µg/m³ for respirable dust. If the observed perimeter air monitoring readings were observed as approaching these thresholds, GZA personnel would direct the contractors to implement the following corrective measures:

- Dust control measures were employed to mitigate the potential for release of airborne particulate matter beyond the limits of the Site perimeter in accordance with RIDEM Air Pollution Control Regulation No. 5, *Fugitive Dust*. Methods of dust control consisted of sprinkling the ground surface with water and/or calcium chloride, covering of temporary stockpiles and mulching; and
- Odor control measures were employed to mitigate the potential for release of odors beyond the limits of the Site perimeter in accordance with RIDEM Air Pollution Control Regulation No. 17, *Odors*. Methods of odor control consisted of backfilling excavations and covering stockpiles or excavations with 6-mil polyethylene sheeting.

In the event that corrective measures did not reduce the observed readings for Dust or TVOCs, construction activities would be ceased until the dust or TVOC levels were within permissible levels.

¹ On September 6, 2016, RIDEM informed National Grid that RIDEM received a formal request for development of a Public Involvement Plan (PIP) with a *PIP Process Initiation Letter*. GZA, on behalf of National Grid, submitted the PIP to RIDEM on October 28, 2016. A revised *PIP* was submitted to RIDEM on May 4, 2017. After responding to comments issued by RIDEM on June 2, 2017, the *PIP* was finalized on June 9, 2017. RIDEM issued a *Public Involvement Plan Approval Letter* on June 28, 2017. The *PIP* is not intended to apply to projects involving limited subsurface disturbance associated with construction activities or those located in areas previously capped consistent with RIDEM requirements. In addition, the *PIP* does not apply to work necessary to maintain day-to-day operations at existing facilities or facility emergencies, including repairs and maintenance of the natural gas regulating facility, compressed natural gas fueling station, liquefied natural gas facility, and cement distribution facility. The *PIP* also does not apply to projects involving minor soil disturbances only (e.g. utility work, installation of fence posts, etc.). Therefore, the PIP does not apply to the projects described herein.

Appendix G

Summary of Earthwork Activities conducted under the September 2012
Soil Management Plan (SMP) (October 2012 through April 2022)
642 Allens Avenue Former Manufactured Gas Plant (MGP)
Providence, Rhode Island

In addition to the perimeter air monitoring, GZA personnel also assisted contractors with segregation of Site soils in accordance with the SMP and management/disposal of Site soils. For projects located in areas with existing engineered caps, GZA assisted the contractor in segregating clean cap material from underlying site soils. Segregated clean cap material was reused to the extent possible. In general, GZA field screened excavated soils for visual and olfactory evidence of gross contamination. As needed, further field screening was performed via jar-headspace screening. Any Site soils presenting evidence of gross contamination was segregated for offsite disposal. Site soils that did not present evidence of gross contamination was reused to the extent possible beneath the engineered cap depending on geotechnical suitability (as determined by the contractor). For all of the projects described below, excess Site soils were disposed of at ESMI in Loudon, New Hampshire under a Bill of Lading (BOL).

In the event that dewatering was required during earthwork activities, dewatering water was generally containerized in fractionation tanks for offsite disposal at a licensed disposal facility under a BOL or manifest. Similarly, if Non-Aqueous Phase Liquid (NAPL) was encountered during earthwork activities, the NAPL was removed via oil absorbent materials and/or skimming/pumping and containerized for offsite disposal at a licensed facility under a BOL or manifest.

GZA also documented restoration activities for the projects described below. Restoration activities for these projects generally consisted of replacing the existing engineered caps in kind, or installation an engineered cap in accordance with the SMP. The engineered caps installed for these projects generally consisted of either (1) two feet of clean soil, (2) one foot of clean soil underlain by permeable geosynthetic; (3) asphalt pavement cover; or (4) permanent structures with concrete slab. As needed, GZA or the contractor collected representative samples of clean imported materials for compliance with the Method 1 Residential Direct Exposure Criteria (RDEC). Clean imported fill was sampled every 2,000 cubic yards for Priority Pollutant 13 metals (PP-13) via EPA Methods 6010C and 7471B, volatile organic compounds (VOCs) via EPA Method 8260B, total petroleum hydrocarbons (TPH) via EPA Method 8100M, SVOCs via EPA Method 8270D, and Polychlorinated Biphenyls (PCBs) via EPA Method 8082A. Import material was sampled at a frequency of one sample per every 500 cubic yards for arsenic. All sampling results for clean imported fill material were below the RDEC.

Sixty seven (67) projects have been conducted under the SMP between September 2012 and April 2022. The approximate location of each of these projects is included on the attached **Figure 1**.

| No. | Date | Activity | Site Area | Contractor |
|-----|---------------------------------|-----------------------------------|---|--|
| 1 | October 2012 | Emergency Natural Gas Line Repair | Natural Gas Regulator Facility | TNEC |
| 2 | October 2012 | Fence Repair | LNG Facility | McGrath Fence Company (McGrath) |
| 3 | January – May 2013 ² | Emergency Natural Gas Line Repair | Natural Gas Regulator Facility | TNEC and Clean Harbors Environmental Services (CHES) |
| 4 | April 2013 | Utility Pole Replacement | Natural Gas Regulator Facility | TNEC |
| 5 | September – | Rip-rap revetment repair | Natural Gas Regulator Facility / LNG Facility | J.H. Lynch and Sons (Lynch) |

² This activity required groundwater dewatering, treatment and management. As described below, the May 23, 2013 *Summary Letter Report – Temporary On-site Treated Groundwater Discharge Permit* was submitted to RIDEM, which provided information about the groundwater management that was completed for this project. Documentation included herein is intended to be a completion report for the soil management aspect of this project.

CRMC PERMIT F2014-04-022 – Site Investigation Activities

State of Rhode Island and Providence Plantations

COASTAL RESOURCES MANAGEMENT COUNCIL

NOTICE OF

ASSENT

CRMC Assent No.: A2016-06-007

Date: June 3, 2016

This certifies that Narragansett Electric Company
has permission to decommission approximately (40) monitoring wells previously authorized by CRMC as per plans submitted to CRMC 06/02/16.

situated at 642 Allens Avenue

Plat No. 101|56

Lot No. 1|1,273,316,317

Said construction operations to be done in accordance with an approved assent on file in the Offices of the Coastal Resources Management Council and subject further to all the provisions of the building ordinances of the :

City/Town of

Providence

and to all the applicable State, Local and Federal provisions. This assent shall expire on July 1, 2019.

Official Designee

Providence, RI 02907

RE: CRMC Assent No. A2016-06-007: decommission approximately (40) monitoring wells previously authorized by CRMC as per plans submitted to CRMC 06/02/16.
Project Location: 642 Allens Avenue, Providence; Plat 101|56, Lot 1|1,273,316,317

Dear Applicant:

The Coastal Resources Management Council has reviewed your project proposal and has determined the findings of no significant impact on coastal resources. In accordance with revisions to RIGL 46-23-6.3 Expiration Tolling Periods (as amended effective June 26, 2013) this project must be completed on or before July 1, 2019. If this project involves excess excavated materials, excess soils, excess construction materials, and debris (including any destructed materials) these materials shall be removed from the site and disposed of at an inland landfill or a suitable and legal upland location. If the project involves earthwork, appropriate erosion controls shall be utilized. All applicable policies, prohibitions, and standards of the RICRMP shall be upheld.

CAUTION: The limits of authorized work shall be only for that which was approved by the CRMC. Any activities or alterations which deviate from the approved plans will require a separate application and review. If the information provided to the CRMC for this review is inaccurate or did not reveal all necessary information or data, then this permit may be found to be null and void. Plans for any future alteration of the shoreline or construction or alteration within the 200' zone of CRMC jurisdiction or in coastal waters must be submitted for review to the CRMC prior to commencing such activity. Under no circumstances will this permit authorize any work which is considered prohibited under any of the sections of the Rhode Island Coastal Resources Management Program.

Permits, licenses or easements issued by the Council are valid only with the conditions and stipulation under which they are granted and imply no guarantee of renewal. The initial application or an application for renewal may be subject to denial or modification. If an application is granted, said permit, license and easement may be subject to revocation and/or modification for failure to comply with the conditions and stipulations under which the same was issued or for other good cause.

Applicant agrees that as a condition to the granting of this assent, members of the Coastal Resources Management Council or its staff shall have access to applicant's property to make on-site inspections to insure compliance with the assent.

A copy of this authorization to perform construction related activities shall be kept on site and available for inspection. NOTE: Failure to have this letter on site or work in excess of your proposal constitutes a violation under this program.

Sincerely,

Sincerely,

William Mosunic, Administrative Officer

The purpose of this letter is to notify you that The Narragansett Electric Company d/b/a National Grid (National Grid) will be conducting additional environmental investigation activities at 642 Allens Avenue in Providence, Rhode Island (herein referred to as the "Site"). The Site is further designated as Assessor's Plat (A.P.) 101 Lot 1, A.P. 56 Lots 5 and 316 of the City of Providence Tax Assessor's plat maps and is the location of a National Grid natural gas regulator station, compressed natural gas (CNG) fueling station, liquefied natural gas (LNG) facility and office building. This notice is being provided to abutting property owners and tenants in accordance with requirements established in the Rhode Island Department of Environmental Management's (RIDEM's) Rules and Regulation for the Investigation and Remediation of Hazardous Materials (Remediation Regulations). Should you be an owner of property that is leased, we request that you please provide a copy of this letter to your tenants.

The planned investigation activities are further described in a *Supplemental Site Investigation Work Plan (SSIWP)* which was prepared by GZA GeoEnvironmental, Inc. (GZA) on behalf of National Grid and submitted to RIDEM in March 2014. The investigation activities will be conducted as described in the SSIWP by GZA on behalf of National Grid. The purpose of the environmental investigations is to further evaluate the nature and extent of impacts to soil and groundwater at the Site. The investigation will involve the completion of test borings, test pit explorations, the installation of monitoring wells, and the sampling of environmental media (soil and groundwater) for laboratory testing. The field work for the investigation is scheduled to begin the week of May 19, 2014 and is expected to require approximately two months to complete.

If you would like more information or have any questions, please contact Amy Willoughby of National Grid at 781-907-3644.

Very truly yours,

RE: CRMC Assent No. F2014-04-022
Site: 642 Allens Avenue, Providence
Plat: 101|56 Lot: 1|273,316,317,5

Project Description: Conduct various subsurface soil boring and test pits investigations as per plan submitted to CRMC on April 8, 2014.

The Coastal Resources Management Council has reviewed your project proposal and has determined the findings of no significant impact on coastal resources. In accordance with revisions to RIGL 46-23-6.3 Expiration Tolling Periods (as amended effective June 26, 2013) this project must be completed on or before **July 1, 2018**. If this project involves excess excavated materials, excess soils, excess construction materials, and debris (including any destructed materials) these materials shall be removed from the site and disposed of at an inland landfill or a suitable and legal upland location. **If the project involves earthwork, appropriate erosion controls shall be utilized.** All applicable policies, prohibitions, and standards of the RICRMP shall be upheld.

CAUTION: The limits of authorized work shall be only for that which was approved by the CRMC. Any activities or alterations which deviate from the approved plans will require a separate application and review. If the information provided to the CRMC for this review is inaccurate or did not reveal all necessary information or data, then this permit may be found to be null and void. Plans for any future alteration of the shoreline or construction or alteration within the 200' zone of CRMC jurisdiction or in coastal waters must be submitted for review to the CRMC prior to commencing such activity. Under no circumstances will this permit authorize any work which is considered prohibited under any of the sections of the Rhode Island Coastal Resources Management Program.

Permits, licenses or easements issued by the Council are valid only with the conditions and stipulation under which they are granted and imply no guarantee of renewal. The initial application or an application for renewal may be subject to denial or modification. If an application is granted, said permit, license and easement may be subject to revocation and/or modification for failure to comply with the conditions and stipulations under which the same was issued or for other good cause.

Applicant agrees that as a condition to the granting of this assent, members of the Coastal Resources Management Council or its staff shall have access to applicant's property to make on-site inspections to insure compliance with the assent.

A copy of this authorization to perform construction related activities shall be kept on site and available for inspection. **NOTE:** Failure to have this letter on site or work in excess of your proposal constitutes a violation under this program.

REMARKS

1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.

2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer

3 - Water table observed at 8 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

4 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 30 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-20 feet bgs; Filter Sand placed in annulus from 19-30 feet bgs; Bentonite Seals installed from 2-4 and 18-19 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
3 - Water table observed at 6.5 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 30 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-20 feet bgs; Filter Sand placed in annulus from 19-30 feet bgs; Bentonite Seals installed from 2-3 and 18-19 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.

2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer

3 - Water table observed at 6 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

4 - 5 feet of casing was lost in the borehole from 9 to 14 feet bgs. The boring was aborted and resumed two feet to the north of the original location. The location was excavated via vacuum prior to resuming.
5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 15 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-5 feet bgs; Filter Sand placed in annulus from 4-20 feet bgs; Bentonite Seals installed from 2-4 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

4 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 13 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-3 feet bgs; Filter Sand placed in annulus from 2-20 feet bgs; Bentonite Seals installed from 1-2 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox. Well was installed on 5/19/14 using hollow stem augers. Well installed three feet to the north of the boring location.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - The upper 4 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
3 - Water table observed at 4 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The upper 4 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
3 - Water table observed at 4 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

| 8 | S-8 | 14-16 | 24 | 110 | 8 9 4 3 | S-8 : Medium dense, gray (GLEY 1, 3/N) fine to coarse SAND, little (-) Gravel, little (-) Silt, slight oil-like odor, slight sheen, wet | | 104 | | | | | | Filter Sand |

REMARKS

1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.

2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer

3 - Water table observed at 6 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - 2" Crushed stone present at the surface
 4 - Water table observed at 6 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" diameter, schedule 40, flush joint, threaded, 10-slot PVC well screen at 30 feet bgs. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-20 feet bgs; Filter Sand placed in annulus from 19.5-30 feet bgs; Bentonite Seals installed from 18-19.5 feet bgs. Remaining annulus filled with filter sand. Well protected with a stand pipe.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 34 feet bgs, 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-24 feet bgs; Filter Sand placed in annulus from 24-34 feet bgs; Bentonite Seals installed from 21-22 feet bgs. Remaining annulus filled with filter sand. Well protected with a stand pipe.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - 2" Crushed stone present at the surface.
 4 - Water table observed at 6 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - This boring was completed with an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - Water table observed at 3.5 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - No sampling completed at this location. See GZ-301D for sampling details. Stratum and impacts descriptions inferred from GZ-301D.
 2 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 15 feet bgs. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-5 feet bgs. Filter Sand placed in annulus from 4-15 feet bgs. Bentonite seals installed from 3-4 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted road box.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

ORGANIC SOIL CLASSIFICATION

Fibrous PEAT (Pt) - Lightweight, spongy, mostly visible organic matter, water squeezes readily from sample. Typically near top of deposit.
 Fine Grained PEAT (Pt) - Lightweight, spongy, little visible organic matter, water squeezes readily from sample. Typically below fibrous peat.
 Organic Silt (OL) - Typically gray to dark gray, often has strong H₂S odor. Typically contains shells or shell fragments. Lightweight. Usually found near coastal regions. May contain wide range of sand fractions.
 Organic Clay (OH) - Typically gray to dark gray, high plasticity. Usually found near coastal regions. May contain wide range of sand fractions. Need organic content test for final identification

LABORATORY REPORT – SOIL SAMPLES

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554.00 T-23)
ESS Laboratory Work Order Number: 1405485

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 2:52 pm, May 30, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

CERTIFICATE OF ANALYSIS

Client Name: GZA GeoEnvironmental, Inc.
Client Project ID: 642 Allens Ave
Client Sample ID: Trip Blank 51914
Date Sampled: 05/19/14 00:00
Percent Solids: N/A
Initial Volume: 15
Final Volume: 15
Extraction Method: 5035

ESS Laboratory Work Order: 1405485
ESS Laboratory Sample ID: 1405485-04
Sample Matrix: Solid
Units: mg/kg wet
Analyst: MD
