Sample and Cooler Receipt Checklist

Client: GZA GeoEnvironmental, Inc.
Client Project ID: _____
Shipped/Delivered Via: Client

ESS Project ID: 14050485
Date Project Due: 5/28/14
Days For Project: 5 Day

Items to be checked upon receipt:

- 1. Air Bill Manifest Present? * No
- Air No.: _____
- 2. Were Custody Seals Present? No
- 3. Were Custody Seals Intact? N/A
- 4. Is Radiation count < 100 CPM? Yes
- 5. Is a cooler present? Yes
- Cooler Temp: 2.7
- Iced With: Ice
- 6. Was COC included with samples? Yes
- 7. Was COC signed and dated by client? Yes
- 8. Does the COC match the sample Yes
- 9. Is COC complete and correct? Yes
- 10. Are the samples properly preserved? Yes
- 11. Proper sample containers used? Yes
- 12. Any air bubbles in the VOA vials? N/A
- 13. Holding times exceeded? No
- 14. Sufficient sample volumes? Yes
- 15. Any Subcontracting needed? No
- 16. Are ESS labels on correct containers? Yes No
- 17. Were samples received intact? Yes No
- ESS Sample IDs: _____
- Sub Lab: _____
- Analysis: _____
- TAT: _____

18. Was there need to call project manager to discuss status? If yes, please explain.

Re-log of 1405429-04, -06, -09, -16

Who was called?: _____ By whom? _____

| Sample Number | Properly Preserved | Container Type | # of Containers | Preservative |
|---------------|--------------------|----------------|-----------------|--------------|
| 1 | Yes | 40 ml - VOA | 1 | MeOH |
| 1 | Yes | 8 oz Soil Jar | 2 | NP |
| 2 | Yes | 40 ml - VOA | 1 | MeOH |
| 2 | Yes | 8 oz Soil Jar | 1 | NP |
| 3 | Yes | 40 ml - VOA | 1 | MeOH |
| 3 | Yes | 8 oz Soil Jar | 1 | NP |
| 4 | Yes | 40 ml - VOA | 1 | MeOH |

530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554.00 T-23)
ESS Laboratory Work Order Number: 1405486

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED
By ESS Laboratory at 3:41 pm, May 30, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Notes and Definitions

- S+ Surrogate recovery(ies) above upper control limit (S+).
- B- Blank Spike recovery is below lower control limit (B-).
- C- Continuing Calibration recovery is below lower control limit (C-).
- C+ Continuing Calibration recovery is above upper control limit (C+).
- D Diluted.
- ICV Initial Calibration Verification recovery is outside of control limit (ICV).
- J Reported between MDL and MRL
- B Present in Method Blank (B).
- R- Standard Reference Material is biased low (R-).
- Z17 Temperature is within 23 +/-2 °C.
- U Analyte included in the analysis, but not detected
- Z-10 Soil pH measured in water at 22.5 °C.
- Z-10a Soil pH measured in water at 22.7 °C.
- Z-10b Soil pH measured in water at 23.1 °C.
- Z-10c Soil pH measured in water at 23.5 °C.
- Z-10d Soil pH measured in water at 24.1 °C.
- Q Calibration required quadratic regression (Q).
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554)
ESS Laboratory Work Order Number: 1405553

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED
By ESS Laboratory at 11:55 am, Jun 02, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

SAMPLE RECEIPT

The following samples were received on May 23, 2014 for the analyses specified on the enclosed Chain of Custody Record.

These samples were originally received on hold on May 19, 2014.

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 3:22 pm, Jun 03, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554.00 T-23)
ESS Laboratory Work Order Number: 1405585

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 11:52 am, Jun 03, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laboratory Director

REVIEWED

By ESS Laboratory at 11:26 am, Jun 06, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

ESS Laboratory Work Order: 1405662

SAMPLE RECEIPT

The following samples were received on May 30, 2014 for the analyses specified on the enclosed Chain of Custody Record.

These samples were originally received on hold on May 23, 2014.

| <u>Lab Number</u> | <u>Sample Name</u> | <u>Matrix</u> | <u>Analysis</u> |
|-------------------|--------------------|---------------|---|
| 1405662-01 | GZ-312D S-2 | Soil | 6010B, 7471A, 7841, 8100M, 8260B, 8270C, 9014 |
| 1405662-02 | GZ-318D S-3 | Soil | 6010B, 7471A, 7841, 8100M, 8260B, 8270C, 9014 |
| 1405662-03 | GZ-317D S-2 | Soil | 6010B, 7471A, 7841, 8100M, 8260B, 8270C, 9014 |
| 1405662-04 | Trip Blank-52314 | Soil | 8260B |

Notes and Definitions

- U Analyte included in the analysis, but not detected
- SM Surrogate recovery(ies) outside of criteria due to matrix (UCM/coelution/matrix is present) (SM).
- J Reported between MDL and MRL
- D Diluted.
- B Present in Method Blank (B).
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554.00 T-23)
ESS Laboratory Work Order Number: 1405669

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 5:11 pm, Jun 06, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

SAMPLE RECEIPT

The following samples were received on May 30, 2014 for the analyses specified on the enclosed Chain of Custody Record.

These samples were originally received on hold on May 27, 2014.

| <u>Lab Number</u> | <u>Sample Name</u> | <u>Matrix</u> | <u>Analysis</u> |
|-------------------|--------------------|---------------|---|

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554)
ESS Laboratory Work Order Number: 1406074

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 11:24 am, Jun 13, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

CERTIFICATE OF ANALYSIS

Client Name: GZA GeoEnvironmental, Inc.
Client Project ID: 642 Allens Ave

ESS Laboratory Work Order: 1406074

CURRENT SW-846 METHODOLOGY VERSIONS

Analytical Methods

- 1010A - Flashpoint
- 6010C - ICP
- 6020A - ICP MS
- 7010 - Graphite Furnace
- 7196A - Hexavalent Chromium
- 7470A - Aqueous Mercury
- 7471B - Solid Mercury
- 8011 - EDB/DBCP/TCP
- 8015D - GRO/DRO
- 8081B - Pesticides
- 8082A - PCB
- 8100M - TPH
- 8151A - Herbicides
- 8260B - VOA
- 8270D - SVOA
- 8270D SIM - SVOA Low Level
- 9014 - Cyanide
- 9038 - Sulfate
- 9040C - Aqueous pH
- 9045D - Solid pH (Corrosivity)
- 9050A - Specific Conductance
- 9056A - Anions (IC)
- 9060A - TOC
- 9095B - Paint Filter
- MADEP 04-1.1 - EPH / VPH

Prep Methods

- 3005A - Aqueous ICP Digestion
- 3020A - Aqueous Graphite Furnace / ICP MS Digestion
- 3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
- 3060A - Solid Hexavalent Chromium Digestion
- 3510C - Separatory Funnel Extraction
- 3520C - Liquid / Liquid Extraction
- 3540C - Manual Soxhlet Extraction
- 3541 - Automated Soxhlet Extraction
- 3546 - Microwave Extraction
- 3580A - Waste Dilution
- 5030B - Aqueous Purge and Trap
- 5030C - Aqueous Purge and Trap
- 5035 - Solid Purge and Trap

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554)
ESS Laboratory Work Order Number: 1407013

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 1:58 pm, Jul 09, 2014

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

ESS Laboratory Work Order: 1407013

Notes and Definitions

- Z17 Temperature is within 23 +/-2 °C.
- U Analyte included in the analysis, but not detected
- D Diluted.
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report

Sample and Cooler Receipt Checklist

Client: GZA GeoEnvironmental, Inc.

ESS Project ID: 14070013

Client Project ID: _____

Date Project Due: ~~7/8/14~~ 7/9/14 cmt

Shipped/Delivered Via: ~~ESS Courier~~ Client

Days For Project: 5 Day

Items to be checked upon receipt:

7/2/14 @ ESS

1. Air Bill Manifest Present?

* No

10. Are the samples properly preserved?

Yes

Air No.:

11. Proper sample containers used?

Yes

2. Were Custody Seals Present?

No

12. Any air bubbles in the VOA vials?

N/A

3. Were Custody Seals Intact?

N/A

13. Holding times exceeded?

No

4. Is Radiation count < 100 CPM?

Yes

14. Sufficient sample volumes?

Yes

5. Is a cooler present?

Yes

15. Any Subcontracting needed?

No

Cooler Temp: 1.0

16. Are ESS labels on correct containers?

Yes No

Iced With: Ice

17. Were samples received intact?

Yes No

6. Was COC included with samples?

Yes

ESS Sample IDs: _____

7. Was COC signed and dated by client?

Yes

Sub Lab: _____

8. Does the COC match the sample

Yes

Analysis: _____

9. Is COC complete and correct?

Yes

TAT: _____

18. Was there need to call project manager to discuss status? If yes, please explain.

Who was called?: _____

By whom? _____

| Sample Number | Properly Preserved | Container Type | # of Containers | Preservative |
|---------------|--------------------|----------------|-----------------|--------------|
| 1 | Yes | 8 oz Soil Jar | 1 | NP |
| 2 | Yes | 8 oz Soil Jar | 1 | NP |
| 3 | Yes | 8 oz Soil Jar | 1 | NP |
| 4 | Yes | 8 oz Soil Jar | 1 | NP |
| 5 | Yes | 8 oz Soil Jar | 1 | NP |
| 6 | Yes | 8 oz Soil Jar | 1 | NP |
| 7 | Yes | 8 oz Soil Jar | 1 | NP |
| 8 | Yes | 8 oz Soil Jar | 1 | NP |
| 9 | Yes | 8 oz Soil Jar | 1 | NP |
| 10 | Yes | 8 oz Soil Jar | 1 | NP |
| 11 | Yes | 8 oz Soil Jar | 1 | NP |

CERTIFICATE OF ANALYSIS

Meg Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, RI 02909

RE: 642 Allens Ave (03.0033554)
ESS Laboratory Work Order Number: 1507459

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 4:15 pm, Jul 27, 2015

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with NELAC Standards, A2LA and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

SAMPLE RECEIPT

The following samples were received on July 20, 2015 for the analyses specified on the enclosed Chain of Custody Record.

| Lab Number | Sample Name | Matrix | Analysis |
|-------------------|--------------------|---------------|------------------|
| 1507459-01 | SS-308 | Soil | 1312, 1312/6010B |
| 1507459-02 | SS-309 | Soil | 1312, 1312/6010B |
| 1507459-03 | SS-310 | Soil | 1312, 1312/6010B |
| 1507459-04 | SS-304 | Soil | 1312, 1312/6010B |
| 1507459-05 | SS-303 | Soil | 1312, 1312/6010B |

CURRENT SW-846 METHODOLOGY VERSIONS

Analytical Methods

- 1010A - Flashpoint
- 6010C - ICP
- 6020A - ICP MS
- 7010 - Graphite Furnace
- 7196A - Hexavalent Chromium
- 7470A - Aqueous Mercury
- 7471B - Solid Mercury
- 8011 - EDB/DBCP/TCP
- 8015D - GRO/DRO
- 8081B - Pesticides
- 8082A - PCB
- 8100M - TPH
- 8151A - Herbicides
- 8260B - VOA
- 8270D - SVOA
- 8270D SIM - SVOA Low Level
- 9014 - Cyanide
- 9038 - Sulfate
- 9040C - Aqueous pH
- 9045D - Solid pH (Corrosivity)
- 9050A - Specific Conductance
- 9056A - Anions (IC)
- 9060A - TOC
- 9095B - Paint Filter
- MADEP 04-1.1 - EPH / VPH

Prep Methods

- 3005A - Aqueous ICP Digestion
- 3020A - Aqueous Graphite Furnace / ICP MS Digestion
- 3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
- 3060A - Solid Hexavalent Chromium Digestion
- 3510C - Separatory Funnel Extraction
- 3520C - Liquid / Liquid Extraction
- 3540C - Manual Soxhlet Extraction
- 3541 - Automated Soxhlet Extraction
- 3546 - Microwave Extraction
- 3580A - Waste Dilution
- 5030B - Aqueous Purge and Trap
- 5030C - Aqueous Purge and Trap
- 5035 - Solid Purge and Trap

SW846 Reactivity Methods 7.3.3.2 (Reactive Cyanide) and 7.3.4.1 (Reactive Sulfide) have been withdrawn by EPA. These methods are reported per client request and are not NELAP accredited.

APPENDIX N

SUMMARY OF SOIL QA/QC RESULTS

Appendix N

Summary of QA/QC Results
642 Allens Avenue Former MGP
Providence, Rhode Island

All sample collection, handling, storage, field screening methods, transportation, and analyses were conducted in general accordance with the *SSIWP* to ensure that results are accurate and representative. In addition and as described below, in accordance with the *SSIWP*, GZA collected and analyzed field duplicate samples and trip blanks.

Upon receipt, GZA audited the analytical data to assess whether the analytical data met the data quality objectives of the project. This audit included evaluation of QA/QC samples (*e.g.*, Lab Control Samples/Lab Control Sample Duplicates, Method Blanks, Field Blanks, and Field Duplicates) to evaluate the representativeness, comparability, completeness, precision, accuracy, and sensitivity of the analytical data.

The results of this audit by laboratory data package generally indicated the following:

- Chloroform and to a lesser extent methylene chloride, common laboratory contaminants, were detected in the method blanks associated with laboratory work orders 1405486, 1405553, 1406074, 1405579, 1405585, 1405662, 1405485, and 1405669. Based on the new quantitation limits for acetone and methylene chloride, the positive results in all of the samples have been qualified as non-detects. The table below has been prepared to qualify the detections.

| Work Order No. and Batch | Analyte and Concentration Detected in Method Blank | New Quantitation Limit | Samples Effected and Lab Reported Detected Value | Action |
|--------------------------|--|------------------------|---|--|
| 1405486 | | | | |

Appendix N

Summary of QA/QC Results
 642 Allens Avenue Former MGP
 Providence, Rhode Island

- Besides the chloroform detected in trip blanks (as noted above), VOCs were not detected in the 7 trip blanks that accompanied the soil samples, suggesting cross contamination was not an issue during soil sampling handling and transportation activities.
- Blank spike recoveries were slightly above the acceptance range for acetone and the data should be considered to have a high bias. Acetone has not been identified as a contaminant of concern at the Site. Thus, GZA considers the acetone data to be acceptable.
- Matrix effects in two soil samples (GZ-317D S-2 and GZ-319D S-3) caused high VOC internal standard recoveries. Analytes that were detected in sample GZ-317D S-2 should be considered to be biased high: 1,2,4-Trimethylbenzene, 1,3,5-Trimethylbenzene, Benzene, Ethylbenzene, Naphthalene, n-Butylbenzene, Toluene and xylenes. Analytes were not detected in sample GZ-317D S-2 that would be qualified based on these high internal standard recoveries. As the data is reported with a high bias, no qualifier is applied.
- The standard reference material standard for silver was detected outside of the criteria in Batch CE42308 (samples GZ-321S S-2 (0.55 mg/kg), GZ-322S S-2 (0.81 mg/kg), GZ-323S S-2 (0.62 mg/kg), GZ-324 S-2 (0.5 mg/kg), BD-052014 (ND), GZ-307S S-3 (0.49 mg/kg), GZ-308S S-2 (ND), and GZ-309D S-3 (ND)). The standard was detected below the criteria which could lead to a low bias for detections. Thus, non-detects and positive results should be considered estimated values and will be marked with a “J” qualifier in the data tables.
- Blank spike recoveries were slightly below the acceptable range for WO 1406074 Batch CF40906 (GZ-315D S-3, GZ-310D S-2, GZ-320D S-3, and BD-052814) for antimony, beryllium, lead and zinc. There is a possibility for these analytes to be reported with a low bias. The below table presents a summary of these metals results. Thus, non-detects and positive results should be considered estimated values and will be marked with a “J” qualifier in the data tables.

| Analyte (mg/kg) | RIDEM I/C-DEC | RIDEM GB Leachability Criteria | RIDEM UCL | GZ-315D S-3 | GZ-310D S-2 | GZ-320D S-3 | BD-052814 |
|-----------------|---------------|--------------------------------|-----------|-------------|-------------|-------------|-----------|
| Antimony | 820 | NE | 10,000 | 8.7 J | <5.0 J | <4.6 J | <4.7 J |
| Beryllium | 1.3 | NE | 10,000 | 0.35 J | 0.3 J | 0.22 J | 0.29 J |
| Lead | 500 | NE | 10,000 | 299 J | 79.3 J | 34.2 J | 41.9 J |
| Zinc | 10,000 | NE | 10,000 | 46.4 J | 128 J | 24.8 J | 43.6 J |

- The Relative Percent Difference (RPD) value for the lab control sample and sample duplicate prepared for metals batch CF40906 exceeded the acceptance criteria of 20 percent for antimony. Thus, positive results and non-detects for antimony should be considered estimated values for batch CF40906 samples GZ-315D S-3, GZ-310D S-2, GZ-320D S-3, and BD-052814. Thus, non-detects and positive results should be considered estimated values and will be marked with a “J” qualifier in the data tables.
- Continuing calibration recovery was detected at very slightly above the acceptable range for a surrogate of TPH (triacontane) for WO 1406074. The data is considered to have a high bias. As the data is reported with a high bias, no qualifier is applied.
- The SVOC analytical results for certain soil samples and SVOC surrogate recoveries in certain laboratory results were calculated from sample dilutions due to elevated contaminant concentrations within the associated soil sample. The analytical results of these diluted samples (flagged with a D) were often above the reporting limit; however, these soil samples contained elevated concentrations of Site constituents of concern above the applicable regulatory criteria and

Appendix N

Summary of QA/QC Results
642 Allens Avenue Former MGP
Providence, Rhode Island

therefore the elevated reporting limits in these samples does not affect data usability. Reporting limits which exceed the corresponding RIDEM criteria are indicated by blue text on the analytical tables.

- The analytical result for several SVOCs including hexachlorocyclopentadiene, 2,4-Dinitrophenol, Pentachlorophenol, Benzoic Acid and 4-Chloroaniline were potentially biased due to either low lab control sample/surrogate recoveries or calibration issues. These SVOC compounds are not expected to be Site COCs; therefore this potential bias does not affect data usability.
- Four duplicate sample sets were submitted for analysis to evaluate sample reproducibility. The RPD was calculated for each compound. Results were varied, which is typical for soil samples of this nature, with some compounds falling within the RPD range and many exceeding the RPD. Some compounds showed better reproducibility than others. This is likely due to the non-homogeneous nature of the soil, particularly the fill, and the irregular distribution of contaminants. To evaluate the data conservatively, the higher results from each sample and duplicate set should be used for decision-making purposes.

APPENDIX O

NEW FIELDS CHEMICAL FINGERPRINTING RESULTS

May 25, 2012

Ms. Margaret Kilpatrick
GZA GeoEnvironmental, Inc.
530 Broadway
Providence, Rhode Island 02909

Subject: Chemical Fingerprinting at National Grid's 642 Allens Avenue Site

Dear Ms. Kilpatrick,

NewFields is pleased to provide you with this letter report, summarizing the results of the analyses conducted on samples collected from the National Grid's facility located at 642 Allens Avenue in Providence, Rhode Island (the Site). The objective of this study was to chemically characterize hydrocarbon residues in the various matrices, identify the type(s) of petroleum products that compose the hydrocarbons, and to determine the degree of environmental weathering.

Sample Summary

Several samples were collected periodically between February 24, 2012 and March 7, 2012. After collection, samples were stored in a secure location on ice and shipped by courier to NewFields' alliance laboratory, Alpha Analytical Laboratory (Alpha). Samples were received intact and in good condition, with some minor exceptions. Extra sample containers were received that were not documented on the chain-of-custody and three vials received were not labeled. GZA GeoEnvironmental, Inc. (GZA) was notified and clarified the labeling issue. These minor exceptions should have little effect on the intended use or interpretation of the data. Upon receipt, the samples were logged into Alpha's laboratory information management system (LIMS) and given unique laboratory identifications. The samples were stored in a limited access refrigerator 4°C until processed by the laboratory staff for chemical fingerprinting analysis. A summary of the samples collected is provided below. Chain-of-custody documentation is provided in Attachment 1.

| Client ID | Matrix | Date Collected | Date Received |
|---------------------|---------------|-----------------------|----------------------|
| CB#1 | Sheen | 03/07/2012 | 03/09/2012 |
| CB#2 | Sheen | 03/07/2012 | 03/09/2012 |
| Parking Lot CB | Sheen | 02/24/2012 | 02/28/2012 |
| Parking Lot CB | Sediment | 02/24/2012 | 02/28/2012 |
| Parking Lot CB | Water | 02/24/2012 | 02/28/2012 |
| Oil Water Separator | Sheen | 02/24/2012 | 02/28/2012 |
| Oil Water Separator | Water | 02/24/2012 | 02/28/2012 |

CB#1 and CB#2 were collected from catch basins where sheens have been observed historically, located along the northwestern boundary of the property. The three samples identified as Parking Lot CB were taken of sheen, sediment on the wall, and water from Catch Basin 1, respectively. The samples identified as Oil Water Separator (sheen and water) were collected from the oil water separator on-Site. The locations of where the samples were collected are shown on the site map provided by GZA (Figure 1).

Sample Analysis

Water samples were extracted for detailed hydrocarbon analysis by spiking a 1-L portion of the sample with surrogate internal standards (SIS) and serially extracting three times with dichloromethane (DCM). The combined extracts were dried over sodium sulfate, concentrated to an appropriate, and spiked with internal standards (IS). Sediment and sheen samples were treated as oil samples and were prepared for analysis as such. A measured portion of the sample was diluted with dichloromethane (DCM), passed through a glass fiber filter with sodium sulfate, and spiked with SIS and IS. Sample extracts were submitted for instrumental analysis.

Samples were analyzed using laboratory methods tailored for the forensic analysis of petroleum described by Douglas et.al. (2007)¹:

- *Total Petroleum Hydrocarbons (TPH) and Fingerprinting*: a modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentrations (C₈-C₄₄). A high resolution gas chromatogram produced by this method provides a detailed “fingerprint” of the hydrocarbons that compose samples. This analysis allowed for the characterization of the general boiling range(s) and type(s) of petroleum or other hydrocarbons present in the sample, as well as the degree(s) of weathering a fugitive product has undergone in the environment.
- *Polycyclic Aromatic Hydrocarbons (PAH) and Petroleum Biomarker Quantification and Fingerprinting*: a modified EPA Method 8270C gas chromatography/mass spectrometry (GC/MS-SIM) method was used to determine the concentrations of semi-volatile compounds or compound groups, including parent and alkylated PAH, sulfur-containing aromatics (dibenzothiophenes), and other compounds that provide specific information regarding the origin/source of PAHs and type(s) of hydrocarbons found in the samples. Tables 1 and 2 lists the PAH and biomarker parameters measured, and provides compound abbreviations used in graphical presentation of the data.

Forensic Analysis

The gas chromatogram, or “fingerprint”, is chromatographic output that describes the distribution of the petroleum hydrocarbons in a sample. The chromatogram depicts, from left to right, the distribution of the most to least volatile hydrocarbons in a sample². The peaks that appear in the chromatogram represent one or more discrete compounds, the height of which is proportional to the abundance of those compounds in the petroleum. Every type of petroleum product has its own unique distribution of hydrocarbons. It is this fundamental gas chromatographic feature – the GC “fingerprint” – that allows the environmental chemist to identify and distinguish one petroleum product from another (i.e., crude oil, light and middle distillate fuels, coal-derived materials, and their combustion and waste residues). Even though weathering processes can significantly alter the chromatographic signature of hydrocarbons, the important characteristics can usually be distinguished from the chromatographic “fingerprint”.

More detailed measurements of the petroleum residues in samples are obtained from gas chromatography/mass spectrometry (GC/MS) data. Measurements of individual hydrocarbon chemicals – particularly polycyclic aromatic hydrocarbons (PAH) – provide specific information about hydrocarbon

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2007) Chemical fingerprinting of hydrocarbons and polychlorinated biphenyls. In: *Introduction to Environmental Forensics*, 2nd Ed., B. Murphy and R. Morrison, Eds., Academic Press, New York, pp. 317-459.

² The elution order (e.g. retention time) of peaks on the chromatogram is a function of volatility with the most volatile compounds eluting early in the GC run (e.g., n-C₁₀), and the less volatile hydrocarbons eluting later in the GC run (e.g., n-C₃₀).

contamination found in samples.³ The distribution patterns within a given homologous group of PAH provide a useful tool for hydrocarbon fingerprinting. Petrogenic (petroleum-derived) products exhibit PAH homolog patterns where compounds with C2- and C3-alkylated PAH are more abundant than the parent (non-alkylated) PAH. The resulting PAH profile is “bell-shaped”. Combustion-derived (pyrogenic) materials exhibit PAH profiles in which the parent PAH is most abundant, and there is an inverse relationship between relative abundance and alkylation level (i.e., C0 > C1 > C2 > C3 > C4). The resulting PAH profile is “skewed” or “sloped”.

Weathering can alter the chromatographic and molecular features of petroleum. The three types of environmental weathering that can affect the chemical composition of subsurface petroleum: evaporation, biodegradation, and solubilization. As oil weathers, environmentally labile chemical hydrocarbons are removed by weathering; many of these labile compounds are the discrete peaks that appear in the chromatogram of fresh petroleum. As such the chromatogram of weathered petroleum has fewer resolved peaks, and the unresolved complex mixture (UCM, or “hump”) shifts toward the higher molecular weight constituents that are more resistant to weathering. The changes observed can often be used to evaluate product weathering in the subsurface environment. Low molecular weight PAH (LPAH) are more susceptible than high molecular weight PAH (HPAH), followed by increasing alkylation level within the same PAH series (i.e., C0 < C1 < C2 < C3). Weathering occurs in predictable chemical sequences, although the rate of weathering is dependent on a wide variety of environmental factors (e.g., hydrocarbon concentration, bacterial populations, availability of nutrients, temperature, moisture content, etc.).

Results and Discussion

The complete Alpha Environmental Testing Reports (ETRs) including all quality control data and chromatograms is maintained by NewFields (ETRs L1203300, L1204030, 1203044, and 1203045). These can be provided if requested. A summary of the laboratory results from the chemical analyses performed in this investigation is provided in Attachment 1. This summary includes chain-of-custody records, gas chromatograms, tabulated results of chemical analyses, and quality control sample results.

Characterization of the Catch Basin Samples

The four site samples collected proximal to Catch Basin 1 (CB#1, Parking lot CB (sheen, sediment, and water)) and the site sample collected at Catch Basin 2 (CB#2) were comprised of complex mixtures of variably weathered petroleum, with the major component being middle distillate petroleum (i.e. diesel fuel, or fuel oil #2). Figures 2 through 6 provide graphical summaries of relevant hydrocarbon characteristics of the five samples. In each of these figures, panel (a) presents the GC/FID chromatogram, (b) a histogram of C₁-C₄ alkylated PAHs and sulfur heterocyclic compounds that compose the sample, and (c) and the *m/z* 191 extracted ion profile (EIP) of triterpane biomarkers.

CB#1

The GC/FID chromatogram of CB#1 sample shows that this sample is composed of a diesel-like middle distillate mixed with broad boiling heavy petroleum. The dominant carbon range is from nC₁₀-nC₄₀. There is a distinct UCM that elutes between nC₁₀ and nC₂₅. Numerous resolved peaks co-elute at specific retention times with the UCM. Many of these peaks are recognized as aliphatic hydrocarbons, branched chain iso-alkanes (e.g., norpristane, pristane, and phytane), and alkylated naphthalene compounds.

The PAH profile of the CB#1 is both petrogenic and pyrogenic in nature. Inspection of the PAH distributions in sample CB#1 shows that the major PAH homologous series are petrogenic in nature and are consistent with fuel oil #2. The evidence for the petroleum-related PAH can be seen in the bell-shaped

³ Stout, S.A., Uhler, A.D., McCarthy, K.J. and Emsbo-Mattingly, S.D. (2002) Chemical Fingerprinting of Hydrocarbons. In: *Introduction to Environmental Forensics*, B. Murphy and R. Morrison, Eds., Academic Press, New York, p. 135-260.

distribution of naphthalenes and the sulfur-containing dibenzothiophenes. The indication of pyrogenic-related PAH can be seen in the skewed homologue patterns, i.e., C₀->C₁->C₂->C₃-substituted homologues (e.g. the phenanthrene, fluoranthene/pyrene and chrysene series) that are emblematic of combustion-derived PAH.

Parking Lot CB (sheen)

The GC/FID chromatogram of Parking Lot CB (sheen) shows that this sample is composed of a diesel-like middle distillate (fuel oil #2) with broad boiling heavy petroleum. The dominant carbon range is from nC₁₀-nC₄₀. There is a distinct UCM that elutes between nC₁₀ and nC₂₅. Numerous resolved peaks co-elute at specific retention times with the UCM. Many of these peaks are recognized branched chain iso-alkanes (e.g., norpristane, pristane, and phytane). Parking Lot CB (sheen) is very similar in composition to CB#1.

The PAH profile of the Parking Lot CB (sheen) is more petrogenic in nature and is much more weathered. Inspection of the PAH distributions in sample Parking Lot CB (sheen) shows that all of the major PAH homologous series are petrogenic in nature and are consistent with fuel oil #2. The evidence for the petroleum-related PAH can be seen in the bell-shaped distribution of phenanthrenes, and the sulfur-containing dibenzothiophenes. The upslope distribution of the naphthalene series is an indication of weathering. The evidence of pyrogenic-related PAH can be seen in the skewed distribution of the fluoranthene/pyrene and chrysene series.

Parking Lot CB (sediment)

The GC/FID chromatogram of Parking Lot CB (sediment) shows that this sample is composed of a diesel-like middle distillate (fuel oil #2) with broad boiling heavy petroleum. The dominant carbon range is from nC₉-nC₄₀. There is a distinct UCM that elutes between nC₉ and nC₂₅. Numerous resolved peaks co-elute at specific retention times with the UCM. Many of these peaks are recognized branched chain iso-alkanes and Isoprenoids (e.g., norpristane, pristane, and phytane).

The PAH profile of the Parking Lot CB (sediment) is more petrogenic in nature. Inspection of the PAH distributions in sample Parking Lot CB (sediment) shows that all of the major PAH homologous series are petrogenic in nature and are consistent with fuel oil #2. The evidence for the petroleum-related PAH can be seen in the bell-shaped distribution of naphthalenes, phenanthrenes, and the sulfur-containing dibenzothiophenes, fluoranthene/pyrenes, and chrysenes. There is no evidence of pyrogenic-related PAH.

Parking Lot CB (water)

The GC/FID chromatogram of Parking Lot CB (water) shows that this sample is composed of a diesel-like middle distillate (fuel oil #2) mixed with trace gasoline range organics (GRO) and broad boiling heavy petroleum. There is a bimodal UCM ranging from nC₉ to nC₄₀ with maximum at nC₁₆ and nC₃₁. Numerous resolved peaks co-elute at specific retention times with the UCM in the nC₉-nC₂₅ range. Many of these peaks are known as branched chain alkanes and isoprenoids. The resolved peaks superimposed on the UCM ranging from nC₂₅ to nC₄₀ are recognized as primarily 4- through 6-ring pyrogenic PAH. . These features are clearly evident in the gas chromatogram shown in Figure 5(A).

The PAH profile of the Parking Lot CB (water) is both petrogenic and pyrogenic in nature, consistent with urban runoff. Inspection of the PAH distributions in Parking Lot CB (water) shows evidence of PAH homologous series that is petrogenic (e.g., naphthalenes and dibenzothiophenes) in addition to the well recognized pattern of pyrogenic PAH, i.e., skewed homologue patterns, i.e., C₀->C₁->C₂->C₃-substituted homologues (e.g. the fluoranthene/pyrene and chrysene series). Additional pyrogenic PAH are noted in the sample, namely the presence of 5- and 6-ring dominantly PAH (e.g., benzo(a)pyrene).

CB#2

The GC/FID chromatogram of CB#2 shows that this sample is consists of a diesel-like middle distillate (fuel oil #2) mixed with broad boiling heavy petroleum. The fingerprint is very similar to Parking Lot

CB (water), however the GRO component is missing. There is a bimodal UCM ranging from nC₁₁ to nC₄₀ with maximum at nC₁₆ and nC₃₁. Numerous resolved peaks co-elute at specific retention times with the UCM in the nC₉-nC₂₅ range. Many of these peaks are known as branched chain alkanes and isoprenoids. The resolved peaks superimposed on the UCM ranging from nC₂₅ to nC₄₀ are recognized as primarily 4- through 6-ring pyrogenic PAH.

The PAH profile of CB#2 is both petrogenic and pyrogenic in nature, consistent with urban runoff. Inspection of the PAH distributions in CB#2 shows evidence of PAH homologous series that is petrogenic (e.g., naphthalenes and dibenzothiophenes) in addition to the well recognized pattern of pyrogenic PAH, i.e., skewed homologue patterns (e.g. the fluoranthene/pyrene and chrysene series).

Weathering Characteristics of the Catch Basin Samples

The degree of relative environmental weathering experienced by the residues found in the samples was evaluated by both qualitative and quantitative analysis of the data and careful examination of the high resolution hydrocarbon fingerprints. The carbon range for the Catch Basin samples was generally in the nC₁₁ to nC₄₀, with the dominant UCM in the nC₁₁ to nC₂₅ range, indicating little differences in the degree of evaporation.

The degree of weathering due to biodegradation was evaluated by determining the ratio of n-C₁₇/pristane. As a petroleum biodegrades, alkanes, represented by nC₁₇, are consumed while the recalcitrant isoprenoids, represented by pristane, remain intact. As the fuel incrementally degrades, the ratio of n-C₁₇/pristane becomes smaller in value. Ratios above 2 generally are consistent with virtually fresh fuels;⁴ ratios of zero represent severely weathered fuel; intermediate values represent intermediate degrees of weathering. The table below shows the ratio of n-C₁₇/pristane for the Catch Basin samples. All samples appear moderate-to-severely biodegraded.

| Field ID | TPH (ppm) | n-C17/Pr | Pr/Ph | Dominant Fingerprint | Degree of Biodegradation |
|---------------------------|-----------|----------|-------|----------------------|--------------------------|
| CB#1 | 712,000 | 0.36 | 1.25 | Diesel Fuel Oil #2 | Moderate- to-Severe |
| Parking Lot CB (sheen) | 587,000 | 0.24 | 1.54 | Diesel/Fuel Oil #2 | Moderate- to-Severe |
| Parking Lot CB (sediment) | 860,000 | 0.43 | 1.31 | Diesel/Fuel Oil #2 | Moderate- to-Severe |
| Parking Lot CB (water) | 9.47 | 0.53 | 1.26 | Diesel/Fuel Oil #2 | Moderate- to-Severe |
| CB#2 | 322,000 | 0.31 | 1.27 | Diesel/Fuel Oil #2 | Moderate- to-Severe |

Characterization of Oil Water Separator Samples (sheen and water)

The GC/FID chromatogram of the Oil Water Separator (sheen) shown in Figure 7(A) is composed of a diesel-like middle distillate (fuel oil #2). There is a distinct UCM that elutes between nC₁₃ and nC₂₄. Numerous resolved peaks co-elute at specific retention times with the UCM. Many of these peaks are recognized as branched chain iso-alkanes and isoprenoids (e.g., norpristane, pristane, and phytane).

The PAH profile of the Oil Water Separator (sheen) is more petrogenic in nature. The PAH distributions in sample Oil Water Separator (sheen) shows that all of the major PAH homologous series are petrogenic in nature and are consistent with fuel oil #2. The evidence for the petroleum-related PAH can be seen in the bell-shaped distribution of fluorenes, phenanthrenes, and dibenzothiophenes. The upslope distribution of the naphthalene series is an indication of weathering. The evidence of pyrogenic-related PAH can be seen in the skewed distribution of the fluoranthene/pyrene and chrysene series

The GC/FID chromatogram of Oil Water Separator (water) presented in Figure 8(A) shows that this sample is composed of a mixture of gasoline range organics and diesel range organics. While there are resolved peaks present ranging from nC₈ to nC₂₅ with a trace UCM ranging from nC₁₀ to nC₂₅, these cannot be classified as gasoline constituents or middle distillate components. The PAH profile shows

⁴ Morrison, R. Environmental Forensics: Principles and Applications. 1999. CRC Press.

evidence of pyrogenic-related PAH as can be seen in the skewed distribution of the fluorene, phenanthrene, and fluoranthene/pyrene series. As shown in figure 8(C), there are no biomarkers present, indicating that the Oil Water separator (water) is not of petroleum origin.

Observations and Summary

Forensic chemistry analytical data from analysis of samples taken from National Grid's 642 Allens Avenue, Providence, Rhode Island indicate that

- The five Catch Basin samples (CB#1, Parking lot CB (sheen, sediment, and water), and CB#2) were comprised of complex mixtures of variably weathered petroleum, with the major component being middle distillate petroleum (i.e. diesel fuel, or fuel oil #2).
- Samples CB#2 and Parking Lot CB (water) are both petrogenic and pyrogenic in nature, consistent with urban runoff.
- Oil Water Separator (sheen) consist of a severely weathered diesel-like middle distillate (i.e., diesel fuel, or fuel oil #2)
- Oil Water Separator (water) consists of gasoline range and diesel range organic compounds. There are no biomarkers present indicating that it is not of petroleum origin.

List of Potential Qualifiers

A: Spectra identified as "Aldol Condensation Product".

B: The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.

C: Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses

D: Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E: Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G: The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.

H: The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I: The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.

J: Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL). This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M: Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND: Not detected at the method detection limit (MDL) for the sample.

NJ: Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P: The RPD between the results for the two columns exceeds the method-specified criteria.

Q: The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL (Metals only.)

R: Analytical results are from sample re-analysis.

RE: Analytical results are from sample re-extraction.

U: Not detected at the reported detection limit for the sample.

List of Potential Qualifiers

A: Spectra identified as "Aldol Condensation Product".

B: The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit.

C: Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses

D: Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.

E: Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

G: The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.

H: The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.

I: The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.

J: Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL). This represents an estimated concentration for Tentatively Identified Compounds (TICs).

M: Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.

ND: Not detected at the method detection limit (MDL) for the sample.

NJ: Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.

P: The RPD between the results for the two columns exceeds the method-specified criteria.

Q: The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL (Metals only.)

R: Analytical results are from sample re-analysis.

RE: Analytical results are from sample re-extraction.

U: Not detected at the reported detection limit for the sample.

| Phenanthrene-d10 | 96 | 95 |
| Benzo[a]pyrene-d12 | 90 | 82 |
| 5B(H)Cholane | N/A | N/A |

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
a: Value outside of QC Limits.
§: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
a: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
§: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.

Subject: Chemical Fingerprinting at 642 Allens Avenue, Providence, Rhode Island

Dear Ms. Kilpatrick,

NewFields is pleased to provide you with this letter report, summarizing the results of the analysis conducted on one groundwater sample collected from an excavation site at National Grid's facility located at 642 Allens Avenue in Providence, Rhode Island. The objective of this study was to determine the composition of the sample.

Sampling and Analysis

One groundwater sample was collected on January 29, 2013 and was packed on ice and shipped the same day by courier to NewFields' alliance laboratory, Alpha Analytical Laboratory (Alpha) for chemical fingerprinting analysis. The sample was received intact and in good condition. Upon receipt, the sample was logged into Alpha's laboratory information management system (LIMS) and given a unique laboratory identification. The sample was stored in a limited access refrigerator at 4°C until processed by the laboratory staff for chemical fingerprinting analysis. Summary information of the sample collected is provided below. Chain-of-custody documentation is provided in Attachment 1.

| Client ID | Lab ID | Matrix | Date Collected | Date Received |
|---------------|------------|--------|----------------|---------------|
| PRODUCT-12913 | 1301009-01 | Water | 29-Jan-13 | 29-Jan-13 |

The product samples were analyzed using a series of methods designed specifically for the forensic analysis of petroleum¹:

- (1) *Total Petroleum Hydrocarbons (TPH) and Fingerprinting*: a modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentration (C₈ – C₄₄). A high resolution gas chromatogram produced by this method provides a detailed "fingerprint" of the hydrocarbons that compose samples. This analysis allowed for the characterization of the general boiling range(s) and type(s) of petroleum or other hydrocarbons present in the sample, as well as the degree(s) of weathering a fugitive product has undergone in the
- (2) *PIANO Quantification and Fingerprinting*: a modified EPA Method 8260B was used for quantification of 88 volatile hydrocarbons contained in the five compound classes, paraffins, isoparaffins, aromatics, naphthenes, and olefins (PIANO) by purge-and-trap gas chromatography and mass spectrometer (GC/MS) operated in a full scan mode. In

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2007) Chemical fingerprinting of hydrocarbons and polychlorinated biphenyls. In: *Introduction to Environmental Forensics, 2nd Ed.*, B. Murphy and R. Morrison, Eds., Academic Press, New York, pp.317-459.

addition, various oxygenated compounds commonly found in oxygenated and reformulated gasolines are targeted, namely, *tert*-butyl alcohol (TBA), methyl-*tert*-butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl-*tert*-butyl ether (ETBE), and *tert*-amyl-methyl ether (TAME). Lead scavengers historically used (1,2-dichloroethane and 1,2-dibromoethane) and various volatile sulfur species are also targeted. A full list of the volatile hydrocarbons measured is provided in Table 1.

Additionally, the sample was analyzed by GC/MS operating in the full scan mode to tentatively identify unknown compounds.

Results and Discussion

The complete Alpha Environmental Testing Report (ETR) including all sample preparation data, instrument calibrations, QC data and chromatograms is maintained on file by NewFields (ETR 1301009). A data summary containing pertinent gas chromatograms and tabulated results of all chemical analyses and quality control results may be found as Attachment 1 to this letter.

All analyses were conducted following established laboratory data quality objectives (DQOs). Appropriate laboratory quality control (QC) samples were processed along with the samples. The QC samples included laboratory method blank (B), laboratory control samples (LCS/LCSD), sample duplicate (D), and a reference materials oil. Resulting data underwent several levels of review. NewFields performed an independent review of the data generated by Alpha Laboratory, to ensure that data quality objectives were satisfied, and that the results were traceable to the raw data. NewFields also reviewed the data for compliance with the laboratory's documented procedures and established laboratory quality objectives. The data were found to be accurate and traceable, and met laboratory established method data quality objectives.

Compositional Features.

The gas chromatogram, or "fingerprint", is the instrument output that defines the distribution of the petroleum hydrocarbons in each sample usually from most volatile to least volatile². The peaks that appear in the chromatogram represent discrete compounds, the height of which is proportional to the abundance of those compounds in the petroleum. Every petroleum product has its own unique distribution of peaks (individual hydrocarbons). It is this fundamental gas chromatographic feature – the GC "fingerprint" – that allows the environmental chemist to identify and distinguish one petroleum product from another.

The GC/FID fingerprint for PRODUCT-12913 is shown in Figure 1. The GC fingerprint shows that this sample is composed mostly of a heavy middle distillate (e.g., cutting oil, light lubricating oil, or gear oil). The dominant carbon range is from C14 to C21. The dominant resolved peaks present in this range include normal alkanes. The dissolved phase also shows evidence of low levels pyrogenic PAHs, which may be indicative of coal tar residue. Refer to Figure 1 for the compound identifications.

Please do not hesitate to contact me if you have any questions regarding this letter.

² The elution order (e.g. retention time) of peaks on the chromatogram is a function of volatility with the most volatile compounds eluting early in the GC run (e.g., n-C₁₀), and the less volatile hydrocarbons eluting later in the GC run (e.g., n-C₃₀).

Sincerely,

A handwritten signature in black ink, appearing to read "Kerylynn Krahforst". The signature is written in a cursive, flowing style.

N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
x: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDI
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
\$: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

Surrogates (% Recovery)
 Dibromofluoromethane 82
 Toluene-d8 86
 4-Bromofluorobenzene 112

U: The analyte was analyzed for but not detected at the sample specific level reported
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
#: Value outside of QC Limits.
\$: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
x: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDI
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
\$: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

Subject: Chemical Fingerprinting at 642 Allens Avenue, Providence, Rhode Island

Dear Ms. Kilpatrick,

This letter report summarizes the results of a forensic chemical analysis conducted on a wipe sample identified as MH-1 that was collected from a manhole at National Grid's facility located at 642 Allens Avenue in Providence, Rhode Island. The objective of this study was to determine the composition of the product collected on the wipe sample.

Sampling and Analysis

One wipe sample was collected in duplicate on December 5, 2012 and was packed on ice and shipped overnight by Federal Express to NewFields' alliance laboratory, Alpha Analytical Laboratory (Alpha) for chemical fingerprinting analysis. Also included in the shipment was an unused wipe (3M Pad). Upon receipt, the samples were logged into Alpha's laboratory information management system (LIMS) and given unique laboratory identifications. The samples were stored in a limited access refrigerator at 4°C until processed for analysis. Summary information of the samples collected is provided below. Chain-of-custody documentation is provided in Attachment 1.

| Client ID | Lab ID | Matrix | Date Collected | Date Received |
|-----------|------------|--------|----------------|---------------|
| MH-1 | 1212011-01 | Wipe | 5-Dec-12 | 6-Dec-12 |
| 3M PAD BD | 1212011-02 | Wipe | 5-Dec-12 | 6-Dec-12 |

The samples were prepared and analyzed for gas chromatography hydrocarbon "fingerprints" and supplemented with quantitative measurements of an extended list of PAH compounds using methods specifically tailored for the forensic analysis of hydrocarbons¹. The principal methods of analysis included:

- (1) *TPH and Gas Chromatographic "Fingerprints"*: a modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentrations over the C₉-C₄₄ molecular weight range. A high resolution gas chromatogram was also developed during this analysis. Such chromatograms provide an important qualitative depiction of the boiling range and general type(s) of hydrocarbons that compose samples, i.e., petroleum products, combustion products, plant waxes, etc.

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2007) Chemical fingerprinting of hydrocarbons and polychlorinated biphenyls. In: *Introduction to Environmental Forensics, 2nd Ed.*, B. Murphy and R. Morrison, Eds., Academic Press, New York, pp. 317-459.

- (2) *Extended PAH Analysis*: a modified EPA Method 8270C gas chromatography/mass spectrometry (GC/MS-SIM) method was used to measure the concentrations of 2- through 6-ring parent (unsubstituted) and C₁-C₄ alkylated PAH and related sulfur-containing poly aromatic compounds. These compounds provide specific information regarding the origin/source of PAHs and type(s) of hydrocarbons found in the samples. Tables 1 lists the PAH compounds measured, and provides compound abbreviations used in graphical presentation of the PAH data.

Results and Discussion

The complete Alpha Environmental Testing Report (ETR) including all sample preparation data, instrument calibrations, QC data and chromatograms is maintained on file by NewFields (ETR 1212011). A data summary containing pertinent gas chromatograms and tabulated results of all chemical analyses and quality control results may be found as Attachment 1 to this letter.

All analyses were conducted following established laboratory data quality objectives (DQOs). Appropriate laboratory quality control (QC) samples were processed along with the samples. The QC samples included laboratory method blank (B), laboratory control samples (LCS/LCSD), sample duplicate (D), and a reference materials oil. Resulting data underwent several levels of review. NewFields performed an independent review of the data generated by Alpha Laboratory, to ensure that data quality objectives were satisfied, and that the results were traceable to the raw data. NewFields also reviewed the data for compliance with the laboratory's documented procedures and established laboratory quality objectives. The data were found to be accurate and traceable, and met laboratory established method data quality objectives.

Forensic Analysis

The gas chromatogram, or "fingerprint", is the instrument output that defines the distribution of the petroleum hydrocarbons in each sample usually from most volatile to least volatile². The peaks that appear in the chromatogram represent discrete compounds, the height of which is proportional to the abundance of those compounds in the petroleum. Every petroleum product has its own unique distribution of peaks (individual hydrocarbons). It is this fundamental gas chromatographic feature – the GC "fingerprint" – that allows the environmental chemist to identify and distinguish one petroleum product from another.

More detailed measurements of the petroleum residues in samples are obtained from gas chromatography/mass spectrometry (GC/MS) data. Measurements of individual hydrocarbon chemicals – particularly polycyclic aromatic hydrocarbons (PAH) – provide specific information about hydrocarbon contamination found in samples.³ The distribution patterns within a given homologous group of PAH provide a useful tool for hydrocarbon fingerprinting. Petrogenic (petroleum-derived) products exhibit PAH homolog patterns where compounds with C₂- and C₃-alkylated PAH are more abundant than the

² The elution order (e.g. retention time) of peaks on the chromatogram is a function of volatility with the most volatile compounds eluting early in the GC run (e.g., n-C₁₀), and the less volatile hydrocarbons eluting later in the GC run (e.g., n-C₃₀).

³ Stout, S.A., Uhler, A.D., McCarthy, K.J. and Emsbo-Mattingly, S.D. (2002) Chemical Fingerprinting of Hydrocarbons. In: *Introduction to Environmental Forensics*, B. Murphy and R. Morrison, Eds., Academic Press, New York, p. 135-260.

parent (non-alkylated) PAH. The resulting PAH profile is “bell-shaped”. Combustion-derived (pyrogenic) materials exhibit PAH profiles in which the parent PAH is most abundant, and there is an inverse relationship between relative abundance and alkylation level (i.e., $C_0 > C_1 > C_2 > C_3 > C_4$). The resulting PAH profile is “skewed” or “sloped”. These distinctive PAH homologue distributions are among the fundamental chemical features used to distinguish petrogenic versus pyrogenic PAH sources in environmental media.

Compositional Features.

The GC/FID fingerprint of wipe sample MH-1 is presented in Figure 1. For reference purposes, the fingerprint of the unused wipe sample 3M PAD BD is presented in Figure 2. The GC chromatogram of MH-1 is composed of a bimodal unresolved complex mixture (UCM: a mixture of hundreds of hydrocarbon chemicals that are unresolved by gas chromatography which appear as a broad “hump” in the chromatogram) over the approximate C_9 to C_{44} range, superimposed a series of unidentified resolved peaks. The small but notable UCM present in MH-1 in the C_{10} to C_{25} diesel range is absent in the unused wipe sample 3M PAD BD.

Wipe sample MH-1 contains PAH derived from urban background, which collectively refers to PAH from a variety of point and non-point sources such as (1) stormwater runoff; (2) direct deposition (atmospheric fallout) of combustion particles (soot) from vehicle exhaust and factories; (3) surface runoff from proximal roadways, parking lots, and bridges; or (4) discharges from recreational, commercial, and military boat/ship traffic.⁴ The distribution of PAH compounds found in the wipe sample MH-1 is shown in Figure 3. For comparison purposes, the PAH distribution profile of the unused wipe sample 3M PAD BD is presented in Figure 4. Wipe sample MH-1 contains a full suite of 2-, 3-, 4-, 5- and 6-ring PAH. The PAH distribution profile is a mixture of petrogenic and pyrogenic patterns as characterized by the “bell-shaped” alkyl homologue distributions of the fluorene and dibenzothiophene series and the abundance of high molecular weight PAH (HPAH) with the 4- and 5-rings homologous series (i.e., fluoranthene/pyrene and chrysene series) demonstrating decreasing abundance with increasing level of alkylation, or a downward slope. Using the algorithm of Stout et al.,⁵ the PAH composition of MH-1 is calculated to be 52% petrogenic PAH, and 48% pyrogenic PAH.

Please do not hesitate to contact me if you have any questions regarding this letter.

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
a: Value outside of QC Limits.
§: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
a: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
§: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.

U: The analyte was analyzed for but not detected at the sample specific level reported
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
#: Value outside of QC Limits.
§: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
R: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDI
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
§: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

Subject: Chemical Fingerprinting at 642 Allens Avenue, Providence, Rhode Island

Dear Ms. Kilpatrick,

NewFields is pleased to provide you with this letter report, summarizing the results of the analysis conducted on one sheen sample collected from National Grid's facility located at 642 Allens Avenue in Providence, Rhode Island. The objective of this study was to determine the composition of the sample.

Sampling and Analysis

One sheen sample was collected on June 5, 2013 and was packed on ice and shipped the following day by courier to NewFields' alliance laboratory, Alpha Analytical Laboratory (Alpha) for chemical fingerprinting analysis. Also included in the shipment was an unused net (sheen sampler). Upon receipt, the samples were logged into Alpha's laboratory information management system (LIMS) and given unique laboratory identifications. The sample was stored in a limited access refrigerator at 4°C until processed by the laboratory staff for chemical fingerprinting analysis. Summary information of the sample collected is provided below. Chain-of-custody documentation is provided in Attachment 1.

| Client ID | Lab ID | Matrix | Date Collected | Date Received |
|-----------|------------|--------|----------------|---------------|
| Sheen-1 | 1306015-01 | Sheen | 05-Jun-13 | 06-Jun-13 |
| Blank | 1306015-02 | Sheen | 05-Jun-13 | 06-Jun-13 |

Samples were analyzed using laboratory methods tailored for the forensic analysis of petroleum described by Douglas et.al. (2007)¹:

- (1) *Total Petroleum Hydrocarbons (TPH) and Fingerprinting*: a modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentration (C₈ – C₄₄). A high resolution gas chromatogram produced by this method provides a detailed "fingerprint" of the hydrocarbons that compose samples. This analysis allowed for the characterization of the general boiling range(s) and type(s) of petroleum or other hydrocarbons present in the sample, as well as the degree(s) of weathering a fugitive product has undergone in the

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2007) Chemical fingerprinting of hydrocarbons and polychlorinated biphenyls. In: *Introduction to Environmental Forensics, 2nd Ed.*, B. Murphy and R. Morrison, Eds., Academic Press, New York, pp. 317-459.

Results and Discussion

The complete Alpha Environmental Testing Report (ETR) including all sample preparation data, instrument calibrations, QC data and chromatograms is maintained on file by NewFields (ETR 1306015). A data summary containing pertinent gas chromatograms and tabulated results of all chemical analyses and quality control results may be found as Attachment 1 to this letter.

All analyses were conducted following established laboratory data quality objectives (DQOs). Appropriate laboratory quality control (QC) samples were processed along with the samples. The QC samples included laboratory method blank (B), laboratory control samples (LCS/LCSD), and a reference materials oil. Resulting data underwent several levels of review. NewFields performed an independent review of the data generated by Alpha Laboratory, to ensure that data quality objectives were satisfied, and that the results were traceable to the raw data. NewFields also reviewed the data for compliance with the laboratory's documented procedures and established laboratory quality objectives. The data were found to be accurate and traceable, and met laboratory established method data quality objectives.

Compositional Features.

Gas chromatography/flame ionization detection (GC/FID) was used to develop a qualitative chromatographic "fingerprint" of the overall hydrocarbon makeup of the samples. The gas chromatogram depicts the distribution of hydrocarbons in a sample, from most volatile to least volatile². The peaks and unresolved complex mixture (UCM) "humps" that appear in the chromatogram represent the occurrence of discrete compounds or mixtures of compounds, the areas of which are proportional to the abundance of those compounds in the sample. Every hydrocarbon material or product has its own near-unique distribution of peaks and thus, a recognizable GC "fingerprint". Even though weathering processes can alter the chromatographic signature of hydrocarbons, important characteristics of the hydrocarbon assemblages can usually be distinguished from the GC "fingerprint".

The GC/FID fingerprint for Sheen-1 is shown in Figure 1. The makeup of this sample is consistent with mixed petroleum-oil tar and parking lot runoff. The gas chromatographic trace (Figure 1) exhibits a broad unresolved complex mixture (UCM) of hydrocarbons between about C₂₅-C₄₀ (i.e. the petroleum component), superimposed upon which are a series of peaks identified as pyrogenic PAH (i.e., fluoranthene (FO), pyrene (PYO), benzo(a)anthracene (BAA), chrysene (CO)). Oil tars are highly enriched in pyrogenic PAH, resulting in a product that contains both petroleum and pyrogenic PAH. (FLO/PYO ratios less than 1.0 distinguish oil tars from coal tars, which have FLO/PYO typically greater than 1.)

For comparison purposes, the GC/FID fingerprint for Blank (unused net) sample is shown in Figure 2. As expected, this sample is free of hydrocarbon contamination. The TPH value is non-detected.

Please do not hesitate to contact me if you have any questions regarding this letter.

² The elution order (e.g. retention time) of peaks on the chromatogram is a function of volatility with the most volatile compounds eluting early in the GC run (e.g., n-C₁₀), and the less volatile hydrocarbons eluting later in the GC run (e.g., n-C₃₀).

Sincerely,

A handwritten signature in black ink that reads "Kerylynn Krahforst". The signature is written in a cursive, flowing style.

Kerylynn Krahforst
Staff Scientist

Subject: Chemical Fingerprinting at 642 Allens Avenue, Providence, Rhode Island

Dear Ms. Kilpatrick,

NewFields is pleased to provide you with this letter report, summarizing the results of the analysis conducted on eleven soil samples and two solid samples collected during the latest field work along the northern portion of the National Grid and Motiva Enterprises property line located at 642 Allens Avenue in Providence, Rhode Island. The objective of this study was to determine the composition of the samples taken and observe the degree of weathering the material has undergone among the field samples collected.

Sampling and Analysis

The field samples were collected between May 22, 2014 and June 4, 2014 by GZA GeoEnvironmental, Inc. and were packed on ice and transported by Alpha courier to NewFields' alliance laboratory, Alpha Analytical Laboratory (Alpha) for chemical fingerprinting analysis. The samples were received intact and in good condition. Upon receipt, the samples were logged into Alpha's laboratory information management system (LIMS) and given a unique laboratory identifications. The samples were stored in a limited access refrigerator at 4°C until processed by the laboratory staff for chemical fingerprinting analysis. The unexpended samples are currently being archived frozen. Soil and solid samples were collected at the locations identified in Figure 1. Summary information of the samples collected is provided below. Chain-of-custody documentation is provided in Attachment 1.

| Lab ID | Client ID | Matrix | Date Collected | Date Received |
|------------|--------------|--------|----------------|---------------|

| 1406010-03 | GZ-310 S-5A | Soil | 6/4/2014 | 6/6/2014 |

The soil and solid samples were analyzed using a method designed specifically for the forensic analysis of petroleum¹:

- (1) *Total Petroleum Hydrocarbons (TPH) and Fingerprinting*: a modified EPA Method 8015B gas chromatography method was used to determine the total petroleum hydrocarbon (TPH) concentration (C₈ – C₄₄). A high resolution gas chromatogram produced by this method provides a detailed “fingerprint” of the hydrocarbons that compose samples. This analysis allowed for the characterization of the general boiling range(s) and type(s) of petroleum or other hydrocarbons present in the samples, as well as the degree(s) of weathering a fugitive product has undergone in the environment.

Results and Discussion

The complete Alpha Environmental Testing Report (ETR) including all sample preparation data, instrument calibrations, QC data and chromatograms is maintained on file by NewFields (ETR 1405021, 1406002 and 1406010). A data summary containing pertinent gas chromatograms and tabulated results of all chemical analyses and quality control results may be found as Attachment 1 to this letter.

All analyses were conducted following established laboratory data quality objectives (DQOs). Appropriate laboratory quality control (QC) samples were processed along with the samples. The QC samples included laboratory method blank (B), laboratory control samples (LCS/LCSD), sample duplicate (D), and a reference materials oil. Resulting data underwent several levels of review. NewFields performed an independent review of the data generated by Alpha Laboratory, to ensure that data quality objectives were satisfied, and that the results were traceable to the raw data. NewFields also reviewed the data for compliance with the laboratory’s documented procedures and established laboratory quality objectives. The data were found to be accurate and traceable, and met laboratory established method data quality objectives.

Compositional Features

The gas chromatogram, or “fingerprint”, is the instrument output that defines the distribution of the petroleum hydrocarbons in each sample usually from most volatile to least volatile². The peaks that appear in the chromatogram represent discrete compounds, the height of which is proportional to the abundance of those compounds in the petroleum. Every petroleum product has its own unique distribution of peaks (individual hydrocarbons). It is this fundamental gas chromatographic feature – the GC “fingerprint” – that allows the environmental chemist to identify and distinguish one petroleum product from another.

Characterization of Field Samples

The field samples were assembled into three groups based on review of the GC/FID Fingerprints as shown in Figures 2, 3 and 4.

¹ Douglas, G.D., Emsbo-Mattingly, S.D., Stout, S.A., Uhler, A.D., and McCarthy, K.J. (2007) Chemical fingerprinting of hydrocarbons and polychlorinated biphenyls. In: *Introduction to Environmental Forensics, 2nd Ed.*, B. Murphy and R. Morrison, Eds., Academic Press, New York, pp.317-459.

² The elution order (e.g. retention time) of peaks on the chromatogram is a function of volatility with the most volatile compounds eluting early in the GC run (e.g., n-C₁₀), and the less volatile hydrocarbons eluting later in the GC run (e.g., n-C₃₀).

The GC/FID fingerprints assembled in Figure 2 include field samples (GZ-304D S-5, GZ-304D S-7, GZ-306S S-4, GZ-310 S-5A, GZ-313D S-10). These GC fingerprints show samples are composed exclusively of tar impacted hydrocarbons. The dominant carbon range extends from C9 to C40+ range. The dominant hydrocarbons present are the polycyclic aromatic hydrocarbons (PAH), particularly parent (non-alkylated) PAH compounds commonly observed in tar impacted samples. The tar material present in these field samples vary in degrees of weathering. Refer to Table 1 for the compound identifications.

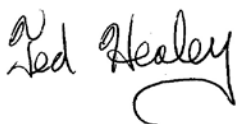

The GC/FID fingerprints assembled in Figure 3 include field samples (GZ-305S S-5 and GZ-306S S-5). These GC/FID fingerprints show samples are composed of a mixture of middle distillate, heavy petroleum and tar. The dominant carbon ranges that make up these materials can be identified by the bimodal unresolved complex mixture (UCM) in the C9 to C22 range and C22 to C40+ range. The complete absence of the weather susceptible normal alkanes and less weather susceptible isoprenoids in both the middle distillate range and heavy petroleum range is evidence for a highly weathered hydrocarbon material(s). Also observed in the chromatograms was the remaining dominant hydrocarbons present being the polycyclic aromatic hydrocarbons, particularly parent (non-alkylated) PAH compounds commonly observed in tar impacted samples albeit at lower concentrations found in field samples displayed in Figure 2 but indeed present. The tar component also being highly weathered.

The GC/FID fingerprints assembled in Figure 4 include field samples (GZ-302D S-10, GZ-303D S-8, GZ-307SR S-6, GZ-308SR S-4, GZ-309D S-4, GZ-312D S-4). These GC/FID fingerprints show samples are composed largely of a middle distillate and to a lesser extent heavy petroleum. The dominant carbon ranges that make up these materials can be identified by the bimodal unresolved complex mixture (UCM) in the C9 to C22 range and C22 to C40+ range. The proportions of middle distillate to heavy petroleum vary amongst field samples where sample GZ-302D S-10 is predominantly middle distillate while other samples have larger proportions of the heavy petroleum. The complete absence of the weather susceptible normal alkanes and less weather susceptible isoprenoids in both the middle distillate range and heavy petroleum range is evidence for a highly weathered hydrocarbon material(s).

In order to determine if the hydrocarbon materials identified in these thirteen field samples are similar in chemical makeup or of varying character, further analyses (i.e. PAH and Biomarker Quantification and Fingerprinting) would need to be performed for further detailed identification.

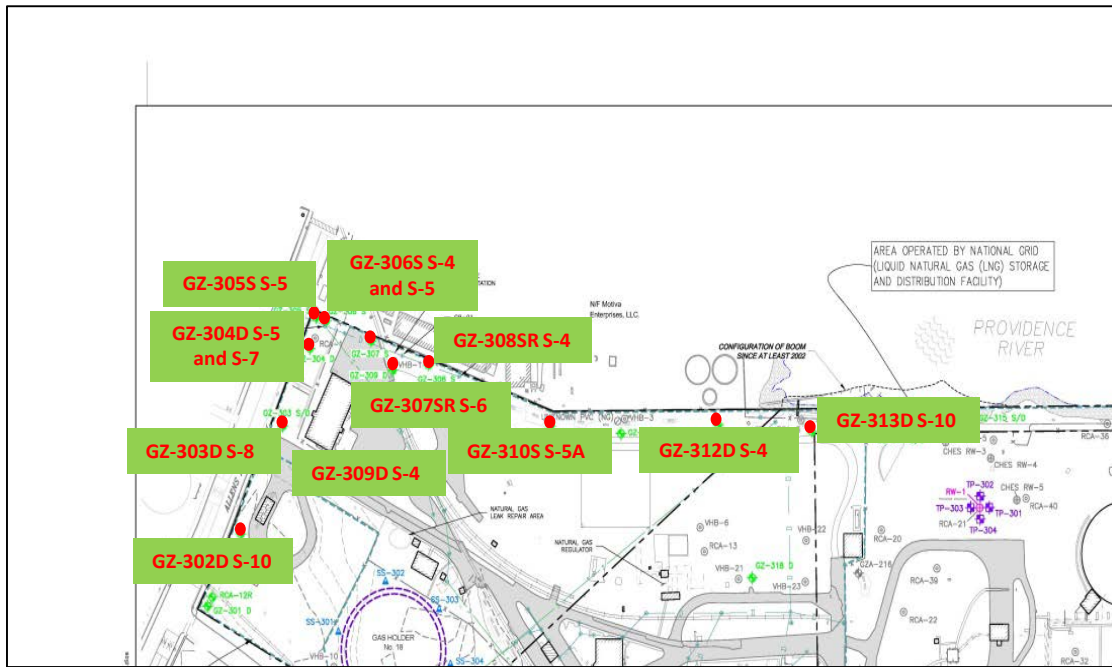

If you have any questions regarding this report, please do not hesitate to call me at (781) 681-5040 x109.

Sincerely,

Ted Healey
Staff Scientist

Subject: 642 Allens Ave Samples

Hi Sophia and Meg,

The GZA 642 Allens Ave COC's received on Friday are attached.

Also attached is a table identifying the discrepancies between the COC and the sample labels, and where sometimes noted, the lids on the jars as well.

Could you confirm what is correct?

Thanks

Keep me posted this week if you need another pickup.

Ted

Sample Delivery Group Form

Laboratory Job No: 1406006 / 1406010
Receipt Date/Time: 6-16-14 10:45

Client: NEWFIELDS
SDG Reviewer: [Signature]

Samples Delivered By:

[X] Alpha Courier [] Client [] UPS [] FedEx [] Other
Bill of Laden: [] Yes [] Unavailable Tracking #: NA

Chain of Custody: [X] Present [] Absent

Custody Seals: [X] Absent [] Present/Intact [] Present/Broken

Cooler/Sample Temperature:

Is Ice/Blue Ice present? [X] Yes [] No [] N/A

Temp taken from: Temp Blank: (a) (b) (c) (d) (e)

IR Gun: (a) 5.6°C (b) (c) (d) (e)

IR Gun SN (circle one): 090512810 100311463

Was Temp: [X] 2-6 Celsius

[] <2 Celsius ... were samples frozen upon receipt? [] Yes [] No

[] >6 Celsius ... were samples delivered direct from site? [] Yes [] No

Containers Received:

[] Broken/Leaking

[X] Intact

Sample IDs:

Sample IDs:

All Containers Accounted For? [X] Yes

[] No:

Extra Samples Received? [X] No

[] Yes:

Do Sample Labels and COC agree? [X] Yes

[] No:

Are Samples in Appropriate Containers? [X] Yes

[] No:

Are samples rec'd within holding time? [X] Yes

[] No:

* Please note: the analysis of pH will always be performed beyond the regulatory-required holding time of 15 min. from the time of collection.

pH of samples upon receipt: [X] N/A [] <2 [] >12 and/or []

Are samples properly preserved? [] Yes [] No If No then.....

Initial pH= preserved In-House with [] HCL [] H2SO4 [] HNO3 [] NaOH <<Final pH = >>

Other Issues:

Chlorine Check: [] N/A [] Present [] Absent

VOA/PH vials: [] Yes [X] No Preserved? [] Yes [] No If yes: [] HCL, []

Aqueous: vials contain head space? [] No [] Yes:

Soils: MeOH covering soil? [] Yes [] No:

Reagent H2O Preserved vials Frozen @ date/time:

Frozen by Client? [] No [] Yes @ date/time:

Was Client notified of any discrepancies listed above? [] Yes [] No [X] N/A

If Yes: Call Tracker #

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
#: Value outside of QC Limits.
\$: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
x: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
\$: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
#: Value outside of QC Limits.
\$: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
x: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
\$: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

U: The analyte was analyzed for but not detected at the sample specific level reported.
B: Found in associated blank as well as sample.
J: Estimated value, below quantitation limit.
E: Estimated value, exceeds the upper limit of calibration.
NA: Not Applicable
D: Secondary Dilution Performed
D1: Tertiary Dilution Performed
#: Value outside of QC Limits.
\$: Surrogate value outside of acceptable range.
X: It is not possible to calculate RPD, one result is below the detection limit, the other is above reporting limit.
G: Matrix Interference.
P: Greater than 40% RPD between the two columns, the higher value is reported according to the method.
I: Due to interference, the lower value is reported.
N: Spike recovery outside control limits.
E: Estimated due to Interference. (Metals)
x: Duplicate outside control limits.
P: Spike compound. (Metals)
J: Below CRDL, Project DL, or RL but greater than or equal to MDL
C: Sample concentration is > 4 times the spike level, recovery limits do not apply. (Metals)
S: Spike Compound. (Organics)
\$: RPD criteria not applicable to results less than 5 times the reporting limit. (Metals)
T: Tentatively identified corexit compound.
C: Co-elution.
Z: Result not surrogate corrected.
DL: Surrogate result diluted out of sample.
W: Matrix interference may be present based on chemical reasonableness evaluation.

Test Pit Excavation Log

| | | | | |
|---|-----------------|---|-------------------|-----------------------------------|
|  Environmental Science Services, Inc. 172 West Exchange Street, Suite 101 Providence, Rhode Island 02903 (401) 421-0398 Environmental Scientists, Engineers, and Planners | Client | Providence Gas Company | Test Pit No. | F41 |
| | Site Name | Allens Avenue Remediation Project | Date | 9/25/00 |
| | Site Address | 642 Allens Avenue, Providence, Rhode Island | Observed By | D. Issa, S. Courtemanche, A. Frye |
| | Job Number | P151-002 | Checked By | Gary Kaufman |
| | Contractor | Tantara Corporation | Test Pit Depth | 7.5 Feet |
| | Excavator Reach | 12 feet | Groundwater Depth | 7.5 Feet |

Test Pit Description

- 0-6" Approximately 1/2 inch root layer over 6" light brown topsoil.
- 6-18" Black slag, tan roofing paper with black staining. Mothball odor.
- 18-57" Asphalt pieces (some hard, some soft and pliable PID = 11 ppm), red and white brick fragments, coal fragments, glass, metal, copper, and other fill. Strong mothball odor.
- 57-90" Slag. Mothball odor.

Remarks:

Mothball odor during entire excavation. PID over excavation peaked at 3.3 ppm.

Groundwater entering bottom of excavation at 7.5 feet. No sheen visible.

Location/Sketch:

West side of PGC Control Building adjacent to billboard and Boring F41. See Figure 2 in SIR.

Soil Boring Report

PROJECT
New England Gas Company
642 Allens Avenue
Providence, Rhode Island

Report of Boring No. **VHB-1**
 Well ID: **VHB-1**
 Job Number: **71274** Sheet 1 of 1

Drilling Company: **Subsurface Drilling and Remediation** Boring Location: **By office / property line north**
 Driller: **Jim Goldthwaite / Josh Downing** Elevation: **NA** Datum: **NA**
 Inspector: **Keith Sullivan / Adam Rosenblatt** Start Date: **1/15/2002** End Date: **1/15/2002**

The borings were drilled by hollow-stem auger. Unless otherwise noted, the soil samples were collected using a 2' split-spoon driven with a 140-lb. hammer falling 30".

Soil Boring Report

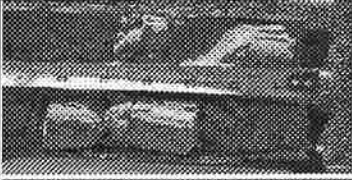

PROJECT
New England Gas Company
642 Allens Avenue
Providence, Rhode Island

Report of Boring No. **VHB-14**

Well ID: **NA**

Job Number: **71274** Sheet 1 of 1

Drilling Company: **Subsurface Drilling and Remediation**

Boring Location: **West of Office, along Allens Ave.**

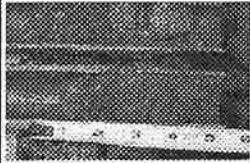

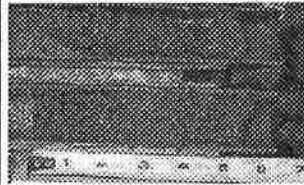

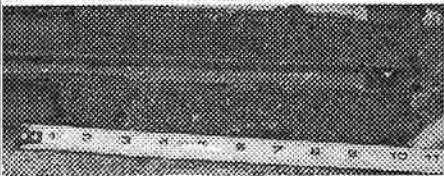

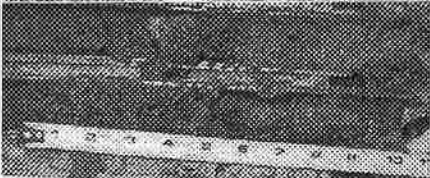

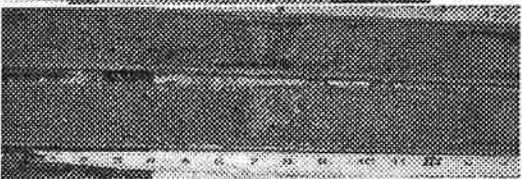

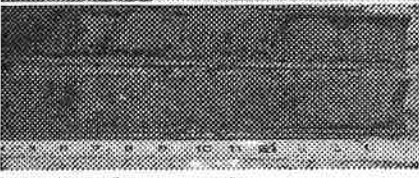

Driller: **Jim Goldthwaite / Josh Downing**

Elevation: **NA** Datum: **NA**

Inspector: **Keith Sullivan / Adam Rosenblatt**

Start Date: **1/17/2002** End Date: **1/17/2002**

The borings were drilled by hollow-stem auger. Unless otherwise noted, the soil samples were collected using a 2" split-spoon driven with a 140-lb. hammer falling 30".

| Depth (ft) | PID Reading | Sample No. | Pen/Rec | Blows/6" | SAMPLE DESCRIPTION | Boring Photo |
|------------|-------------|------------|---------|----------------|--|--|
| 0 - 5 | ND | S1 | NA | NA | Auger cuttings - Loose, dark brown, medium SAND and silt, trace coal slag, moist. | |
| 5 - 7 | ND | S7 | 24 / 5 | 1 - 1 1 - 1 | Brown to black, very loose SAND and silt, some coal slag, trace gravel, moist, no sheen or odor. |  |
| 7 - 9 | 1.8 | S3 | 24 / 6 | 1 - 4 5 - 1 | Black, loose COAL SLAG and rock fragments, trace brick, wet, no sheen or odor. |  |
| 9 - 11 | 1.8 | S4 | 24 / 10 | 1 - 3 3 - 4 | Gray to black, loose, medium to coarse SAND, trace brick, no sheen or odors. |  |
| 10 - 12 | 1.8 | S5 | 24 / 6 | 1 - 4 5 - 1 | 7" gray to black, loose, medium to coarse SAND over 7" light grayish brown medium SAND trace gravel, wet no sheen or odor. |  |
| 12 - 14 | 1.2 | S6 | 24 / 16 | 3 - 3 4 - 5 | Light gray, loose, medium to coarse SAND, trace gravel, wet no sheen or odor. |  |
| | | | | | |  |

Bottom of exploration 14' below grade.

Soil Boring Report

PROJECT
New England Gas Company
642 Allens Avenue
Providence, Rhode Island

Report of Boring No. VHB-15

Well ID: NA

Job Number: 71274 Sheet 1 of 1

Drilling Company: Subsurface Drilling and Remediation

Boring Location: Out front, north of VHB 14

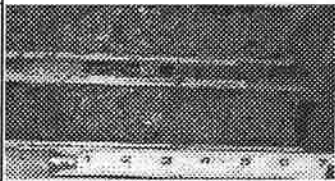

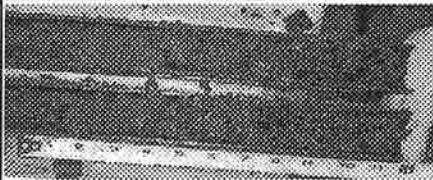

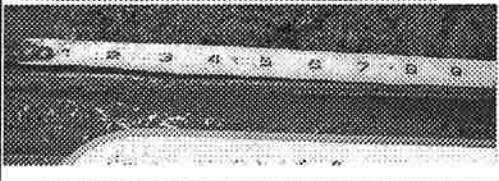

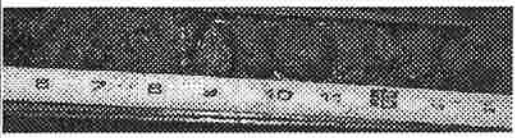

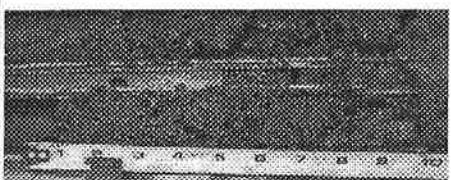

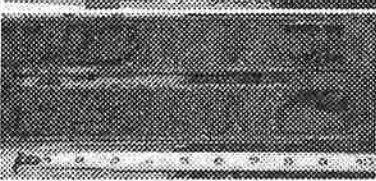

Driller: Jim Goldthwaite / Josh Downing

Elevation: NA Datum: NA

Inspector: Keith Sullivan / Adam Rosenblatt

Start Date: 1/17/2002 End Date: 1/17/2002

The borings were drilled by hollow-stem auger. Unless otherwise noted, the soil samples were collected using a 2' split-spoon driven with a 140-lb. hammer falling 30".

| Depth (ft) | PID Reading | Sample No. | Pen/Rec | Blows/6" | SAMPLE DESCRIPTION | Boring Photo |
|--|-------------|---|---------|---|--|--|
| 0 - 5 | ND | S1 | NA | NA | Auger cuttings - Loose, dark brown, medium SAND and silt, trace coal slag, moist. | |
| 5 - 7 | ND | S7 | 24 / 6 | 2 - 1 2 - 1 | Rusty brown to black, very loose, COAL fragments, moist, no sheen or odor. |  |
| 7 - 9 | ND | S3 | 24 / 12 | 1 - 2 3 - 3 | Black, loose, medium SAND, some silt, little gravel, trace wood, wet, gray staining, moderate chemical odor. |  |
| 9 - 11 | 3.0 | S4 | 24 / 8 | 2 - 3 3 - 5 | Black, loose, GRAVEL, some silt and medium sand, wet, faint sheen, faint unrecognizable odor. |  |
| | | | | | |  |
| 10 - 12 | 3.0 | S5 | 24 / 10 | 7 - 5 3 - 3 | Black, loose, GRAVEL, some silt, some medium sand, wet, faint chemical odor, coal tar sheen. |  |
| 12 - 14 | 5.5 | S6 | 24 / 10 | 2 - 2 4 - 9 | 2" black, loose, GRAVEL, some silt, over 8" black, loose, medium sand, wet, faint chemical odor, coal tar sheen. |  |

REMARKS

1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.

2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer

3 - Water table observed at 8 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

4 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 30 feet bgs, 2" Diameter, Schedule 40, flush joint, PVC Riser installed from 0-20 feet bgs; Filter Sand placed in annulus from 19-30 feet bgs; Bentonite Seals installed from 16-19 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - No sampling completed at this location. See GZ-302D for sampling details. Stratum and impact descriptions inferred from GZ-302D.
 2 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 15 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-5 feet bgs; Filter Sand placed in annulus from 4-15 feet bgs; Bentonite Seals installed from 3-4 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - Water table observed at 6.5 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
 1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - Water table observed at 6 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
4 - 5 feet of casing was lost in the borehole from 9 to 14 feet bgs. The boring was aborted and resumed two feet to the north of the original location. The location was excavated via vacuum prior to resuming.
5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 15 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-5 feet bgs; Filter Sand placed in annulus from 4-20 feet bgs; Bentonite Seals installed from 2-4 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - The upper 4 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
3 - Water table observed at 4 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

4 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 12 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-2 feet bgs; Filter Sand placed in annulus from 2-22 feet bgs; Bentonite Seals installed from 0.5-1.5 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox. Well was installed on 5/19/14 using hollow stem augers. Well was installed approximately five feet to the south of the boring location.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS
1 - The upper 4 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
3 - Water table observed at 4 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

Notes:
 ND - Not Detected NE - Not Established R - sample rejected by the lab
 NA - Not Analyzed N/A - Not Applicable

Bold Concentrations and shaded cells indicate an exceedance of RIDEM I/C-DEC

Underlined concentrations indicate an exceedance of RIDEM GB Leachability Criteria

Red text indicates an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.

2. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Notes:
 ND - Not Detected NE - Not Established R - sample rejected by
 NA - Not Analyzed N/A - Not Applicable the lab

Bold Concentrations and shaded cells indicate an exceedance of RIDEM I/C-DEC

Underlined concentrations indicate an exceedance of RIDEM GB Leachability Criteria

Red text indicates an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.
2. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Notes:
 ND - Not Detected NE - Not Established R - sample rejected by
 NA - Not Analyzed N/A - Not Applicable the lab

Bold Concentrations and shaded cells indicate an exceedance of RIDEM I/C-DEC

Underlined concentrations indicate an exceedance of RIDEM GB Leachability Criteria

Red text indicates an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.

2. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Notes:
 ND - Not Detected NE - Not Established R - sample rejected by
 NA - Not Analyzed N/A - Not Applicable the lab

Bold Concentrations and shaded cells indicate an exceedance of RIDEM I/C-DEC

Underlined concentrations indicate an exceedance of RIDEM GB Leachability Criteria

Red text indicates an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.
2. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Notes:
 ND - Not Detected NE - Not Established R - sample rejected by the lab
 NA - Not Analyzed N/A - Not Applicable

Bold Concentrations and shaded cells indicate an exceedance of RIDEM I/C-DEC

Underlined concentrations indicate an exceedance of RIDEM GB Leachability Criteria

Red text indicates an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.
2. While the RIDEM Direct Exposure Criteria and GB Leachability Criteria apply to the vadose zone, certain subsurface soil samples were collected below the water table to define the nature and extent of impact. The data comparisons summarized in the tables compare all subsurface soil data (vadose and saturated zone) to the I/C-DEC and GB Leachability criteria.

Notes

- Well is located in the Natural Gas Regulator portion of the Property
- Well is located in the CNG Fueling Station portion of the Property
- Elevations are relative to NAVD 88 Datum
- NP - Indicates No Product observed.
- NS - Not Surveyed
- Blanks indicate no measurement collected on that particular day.
- Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Notes
Well is located in the Natural Gas Regulator portion of the Property
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD 88 Datum
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Notes

- Well is located in the Natural Gas Regulator portion of the Property
- Well is located in the CNG Fueling Station portion of the Property
- Elevations are relative to NAVD 88 Datum
- NP - Indicates No Product observed.
- NS - Not Surveyed
- Blanks indicate no measurement collected on that particular day.
- Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Notes
Well is located in the Natural Gas Regulator portion of the Property
Well is located in the CNG Fueling Station portion of the Property
Elevations are relative to NAVD 88 Datum
NP - Indicates No Product observed.
NS - Not Surveyed
Blanks indicate no measurement collected on that particular day.
Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Notes

- Well is located in the Natural Gas Regulator portion of the Property
- Well is located in the CNG Fueling Station portion of the Property
- Elevations are relative to NAVD 88 Datum
- NP - Indicates No Product observed.
- NS - Not Surveyed
- Blanks indicate no measurement collected on that particular day.
- Potentiometric elevations for wells exhibiting LNAPL include 0.85 correction factor.

Notes:

Well is located in the Natural Gas Regulator portion of the Property

Well is located in the CNG Fueling Station portion of the Property

Gray shading indicates NAPL thickness of equal to or more than 0.01 feet

NG - Not Gauged

ND - Not Detected

NI - Not Installed Yet

Dest - Destroyed

trace - seen or less than 0.01 feet

This table presents LNAPL thickness data for monitoring wells that have exhibited LNAPL thicknesses of at least trace amounts since 2001.

Notes:

ND - Not Detected
NA - Not Analyzed

NE - Not Established
N/A - Not Applicable

Bold Concentrations and shaded cells indicate an exceedance of RIDEM GB Groundwater Objectives

Red text and underlined concentrations indicate an exceedance of RIDEM GB Upper Concentration Limits

1. This table indicates only compounds that were detected, other compounds were analyzed for, but not included here as there were no detections.
2. The detected concentrations were compared to RIDEM Method 1 Criteria.

| Site Address | 642 Allens Avenue, Providence, Rhode Island | Observed By | D. Issa, S. Courtemanche, A. Frye |
| Job Number | P151-002 | Checked By | Gary Kaufman |
| Contractor | Tantara Corporation | Test Pit Depth | 4.5 feet |
| Excavator Reach | 12 feet | Groundwater Depth | 4.5 feet |

Test Pit Description

0-2" Asphalt parking lot cover.

2"-54" Asphaltic-based material, coal-tar like material, petroleum-impacted material, all of varying degrees of compaction. Sweet odor along with strong diesel odor. Highly compacted layer of apparent "cold patch" asphalt, free petroleum present (21-24"). PID = 29 ppm headspace. Strong petroleum odor. Loosely compacted apparent "cold patch" asphalt (24-54"). Groundwater entering excavation at approximately 4.5 feet. Significant sheening on groundwater and strong diesel-like odor, with additional sweet odor. Gravel and cobbles throughout.

Remarks:

PID Over Excavated Material = 60 ppm Sample 1 (Soil at Water Table)
 PID Over Excavation = 8 ppm (peak not sustained) Sample 2 (Loosely Compacted)
 Draeger Xylene = ND Sample 3 (E86 Dense)
 Sample 4 (Moderately Compacted)

Location/Sketch:

Adjacent to Boring E86 (see Figure 2 of SIR) at toe of PGC soil processing slope.

| | Job Number | P151-002 | Checked By | Gary Kaufman |
| | Contractor | Tanlara Corporation | Test Pit Depth | 6 Feet |
| | Excavator Reach | 12 feet | Groundwater Depth | 6 Feet |

Test Pit Description

0-2" Asphalt parking lot.
2-14" Light tan fine sand with some gravel.
14-16" Fine black sand and coal ash. Dry no odors. No measurable PID.
16-24" Slag and red brick with traces of fine sand and silt. Dry.
24-30" Light brown fine to medium sand and gravel.
30-72" Slag and coal with red brick fragments. Wet at 72".

Remarks:
Groundwater entering excavation at approximately 6 feet. No visible sheen.
No PID readings above background. No discernable odors.

Location/Sketch:
Adjacent to Boring F56. See Figure 2 in SIR.

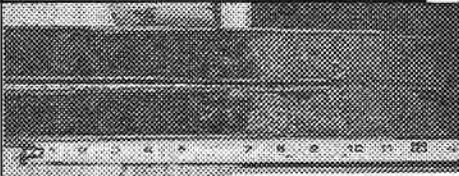

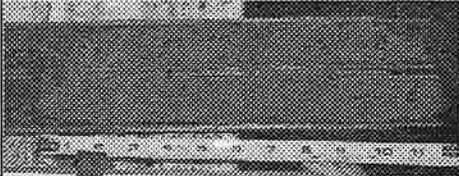

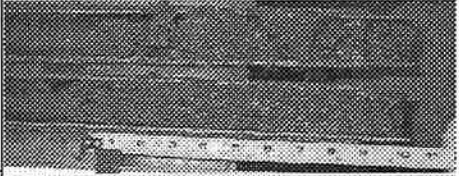

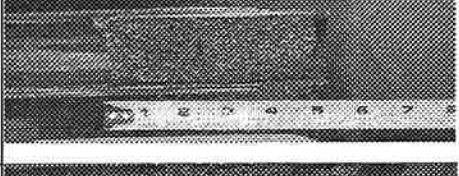

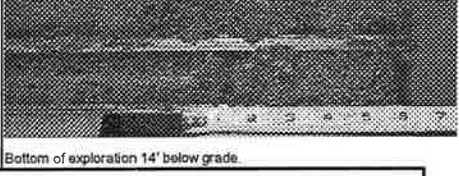

Soil Boring Report

PROJECT
New England Gas Company
642 Allens Avenue
Providence, Rhode Island

Report of Boring No. **VHB-1**
 Well ID: **VHB-1**
 Job Number: **71274** Sheet 1 of 1

Drilling Company: **Subsurface Drilling and Remediation** Boring Location: **By office / property line north**
 Driller: **Jim Goldthwaite / Josh Downing** Elevation: **NA** Datum: **NA**
 Inspector: **Keith Sullivan / Adam Rosenblatt** Start Date: **1/15/2002** End Date: **1/15/2002**

The borings were drilled by hollow-stem auger. Unless otherwise noted, the soil samples were collected using a 2' split-spoon driven with a 140-lb. hammer falling 30".

| 15 | | | | | | | | | | | | | |

REMARKS
 1 - The upper 6 feet was cleared using an air knife and soil vactor truck. Soil samples were collected from the sidewalls. Therefore, blows and SPT values are not applicable for the vacuum excavated portion of the boring.
 2 - The headspace of soil samples was screened for Total Volatile Organic Compounds (TVOCs) using a miniRae 3000 Photoionization Detector (PID) equipped with a 10.6 eV Lamp calibrated to a 100 ppmv isobutylene standard. ND indicates reading below the instruments detection limit of approximately 0.1 ppmv. N/A-Not Applicable, NM-Not Measured, bgs-below ground surface, WOH-Weight of Hammer
 3 - Water table observed at 6.5 feet bgs.
 4 - Coal tar saturated lense observed between 9 and 10 feet bgs.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

5 - A groundwater monitoring well of the following construction was installed: 10 feet of 2" Diameter, Schedule 40, flush joint, threaded, 10-slot PVC well screen at 30 feet. 2" Diameter, Schedule 40, flush joint, threaded PVC Riser installed from 0-20 feet bgs; Filter Sand placed in annulus from 19-30 feet bgs; Bentonite Seals installed from 2-3 and 18-19 feet bgs. Remaining annulus filled with filter sand and clean soil cuttings. Well protected with a flush mounted roadbox.

See Log Key for explanation of sample description, identification procedures, and visual and odor impacts. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.
