1.0 INTRODUCTION

On behalf of The Narragansett Electric Company (TNEC), d/b/a Rhode Island Energy, GZA GeoEnvironmental Inc. (GZA) has prepared this *Monitoring Report* describing activities performed at the Former 642 Allens Avenue Manufactured Gas Plant (MGP) located at 642 Allens Avenue in Providence, Rhode Island. The Site is also defined as Providence Tax Assessors Plat (A.P.) 101 Lot 1 and A.P. 56 Lot 5, 273, 316 and 317. These properties are collectively referred to herein as the "Site." This report describes monitoring activities that were performed at the Site during the 2021 monitoring period. As described further herein, annual monitoring performed in 2021 consisted of approximately monthly routine shoreline observations, semi-annual groundwater elevation/non-aqueous phase liquid (NAPL) gauging events, and an annual groundwater quality sampling event. **Figure C1** (*Title Sheet and Index to Drawings*) presents the Site Locus Plan and **Figure 2** (*Overall Aerial*) presents the location of the Site. **Figure N1** (*General Notes and Legend)* was prepared to provide the legend and notes for the Site plans.

This report is subject to the Limitations presented in **Appendix A** *(Limitations)***.**

1.1 SITE DESCRIPTION

The Site was the location of the Former 642 Allens Avenue MGP. The Site is now largely occupied with natural gas utility operations, which serve the City of Providence and the State of Rhode Island. The Site is located on the east side of Allens Avenue, northeast of the intersection of Allens Avenue and Terminal Road in the City of Providence, Rhode Island (refer to **Figure C1**). The majority of the Site is secured with a locked perimeter chain-link fence. The configuration of this perimeter fencing is shown on **Figure 3A** (*Exploration Location Plan – Former CNG Facility and Natural Gas Regulation Facility*) and **Figure 3B** (*Exploration Location Plan – LNG Facility and Holcim Cement Facility)*.

The approximately 41-acre Site is identified in the City of Providence Tax Assessor's Office as Assessors Plat (A.P.) 56, Lots 5, 273, 316, and 317, and as A.P. 101, Lot 1. The entirety of the Site is currently owned by The Narragansett Electric Company. National Grid LNG, LLC (NGLNG) holds a lease on A.P. 56 Lot 316 and Lafarge Holcim US, Inc. (Holcim) holds a lease on A.P. 56 Lot 273. The entirety of the Site is zoned by the City of Providence as W-3 (Port/Maritime Industrial Waterfront District). The W-3 Port/Maritime Industrial Waterfront District is intended "to promote maritime industrial and commercial uses within the areas of Providence's waterfront, protect the waterfront as a resource for water-dependent industrial uses, and facilitate the renewed use of a vital waterfront". The current Site layout and key features are shown on **Figure 3A** and **Figure 3B**.

For the purpose of this report, the Site has been subdivided into four areas based on current use. **Figure 3A** and **Figure 3B** presents the location and configuration of the following areas:

- Former CNG Facility (portion of A.P. 101 Lot 1);
- Natural Gas Regulation Facility (portion of A.P. 101 Lot 1 and A.P. 56 Lot 5);
- LNG Facility (A.P. 56 Lot 316); and
- Holcim Cement Facility (A.P. 56 Lots 273 and 317).

The following table summarizes the five parcels that make up these four Site areas. Parcel locations are also shown on **Figure 2**.

A.P.	Lot	Lot Size (Acres)	Current Owner	Address	Current Use(s)
101	1	11.35	TNEC	642 Allens Avenue 670 Allens Avenue	Natural Gas Construction Storage Natural Gas Regulation and Distribution Former CNG Fueling Station
56	5	8.90	TNEC	642 Allens Avenue	Natural Gas Construction Storage Natural Gas Regulation and Distribution
56	273	3.90	TNEC	139 Terminal Road	Cement Storage and Distribution
56	316	16.36	TNEC	121 Terminal Road	LNG Facility
56	317	0.49	TNEC	121 Terminal Road	Access Road

The Site has frontage on Allens Avenue to the west and is bounded to the east by the Providence River. It is adjoined to the northwest by Triton Terminaling, LLC, and to the south by Terminal Road, the Former Sun Oil/Providence Port facility, and New England Bituminous Terminal Corporation. **Figure 2** presents the location of the Site and these abutting lots. The area surrounding the Site is industrial in nature, with parcels zoned W-3 or M-2 (both industrial type zoning). The nearest residential lot is located over 1,000 feet to the south of the Site.

Based on review of information presented in the Environmental Resource map maintained by RIDEM (http://www.dem.ri.gov/maps/), groundwater in the area of the Site is classified as "GB," which indicates that groundwater may not be suitable for public or private drinking water use without treatment due to known or presumed degradation.

1.2 SITE BACKGROUND

Historical Site operations have included the former MGP, former liquid petroleum gas (LPG)/ propane gas storage and distribution, and former petroleum storage and distribution. **Figure 3A** and **Figure 3B** present a compilation of relevant historical features and structures associated with past Site operations.

The former MGP operated from 1910 to 1953 and generated gas using the coal carbonization, carbureted water gas, oil gas and producer gas processes. Other by-products, such as tar, ammonia, cyanogen, naphthalene, light oils, hydrogen sulfide, and spent oxides, were removed during the process of gas condensing and purifying in the Former Condenser House (Former Compressor Building No. 1) and the Former Coal Gas Purifier House (present Compressor Building No. 2). Gasification operations were generally conducted proximate to the current LNG facility (**Figure 3B**), with regulating and distribution of the gas closer to the current Natural Gas Regulating Facility (**Figure 3A**).

The LPG plant operated from 1952 to mid-1960s and the propane gas storage and distribution plant operated from the 1960s to the 1980s. These operations supplemented manufactured and natural gas during peak gas demands. LPG/propane operations were generally conducted proximate to the center of the Site near the Former Propane House (**Figure 3A** and **Figure 3B**).

Petroleum products used in the production of manufactured gas was stored in two aboveground storage tanks located at the northeast corner of the Site (proximate to the current LNG tank – **Figure 3B**). Reportedly, Providence Gas Company also constructed an oil or tar storage facility in 1953 (location unknown). Additionally, Gulf Oil Corporation leased a portion of the Site during 1957 and built four aboveground storage tanks (ASTs) for kerosene storage on the premises (exact location of all tanks unknown, although known to be proximate to the existing LNG facility, the location of one of the tanks is shown on **Figure 3B**).

GZA conducted supplemental investigation activities at the Site in 2014, with follow up activities conducted in 2016 and 2017. A summary of these activities, relevant regulatory history of the Site and other background information will be included in an addendum to the April 2003 Site Investigation Report (SIR). This SIR Addendum is expected to be submitted

to RIDEM in 2022. In order to accommodate ongoing projects at the Site, forty-four (44) monitoring wells were decommissioned in 2016. In 2021, GZA re-installed five (5) new monitoring wells, see Section 2.3 below for details. Until these projects are complete, an interim groundwater monitoring program will be performed annually.

2.0 RESULTS OF MONITORING PROGRAM

This section presents the results of the 2021 monitoring program. As indicated previously, this monitoring program consists of monthly shoreline observations, semi-annual groundwater elevation monitoring and NAPL monitoring/recovery, and annual groundwater quality sampling and analysis.

2.1 SHORELINE OBSERVATIONS

Between January and December 2021, the shoreline adjacent to the Site was inspected for the presence of sheens in the Providence River on at least a monthly basis. Portions of the Site's shoreline are surrounded by both hard boom and absorbent sausage boom to contain any observed sheen. This boom has been in place since at least 2002. The current boom configuration is shown on **Figure 3B.** Sheens have been observed intermittently proximate to the shoreline in the cove area. More significant sheens were observed at mid-tide and generally consisted of dull to bright plates of sheen. Sheens observed at high or low tide generally consisted of slight and minor dull plates of sheen. A summary of sheen observations proximate to the cove area is presented in **Table 1** (*Summary of Sheen Observations – 2011 to 2021)*.

2.2 NAPL AND GROUNDWATER ELEVATION MONITORING

Comprehensive gauging rounds of the groundwater monitoring well network are conducted semi-annually for the presence of NAPL and collection of groundwater elevation readings. Gauging was performed in June 2021 and November 2021. **Figure 4** (*Groundwater Monitoring Wells)* presents the location of all monitoring wells at the Site and **Figure 5** (*Shallow Groundwater Contours (November 2021))* presents the shallow groundwater elevations contours based on measurements collected in November 2021. In addition, monthly NAPL measurements were collected from GZ-307S to delineate the extent of NAPL observations. GZ-307S is located proximate to the northern property line near the Gas Control Building (refer to **Figure 3A).** During the gauging events, depth to groundwater and measurements of the presence and thickness of NAPL were recorded. NAPL measurements were gauged using an oil-water interface probe. To gauge the presence of light non-aqueous phase liquid (LNAPL), the probe was lowered into the well until the probe's continuous alarm indicated the presence of LNAPL. When the probe passes through the LNAPL into groundwater, an intermittent alarm is triggered. This information was used to gauge the thickness of LNAPL. Gauging for the presence of dense non-aqueous phase liquid (DNAPL) was conducted in the same manner as the LNAPL. Once the continuous alarm of the interface probe was heard, measurements were recorded to the bottom of the well to record product thickness. Note, because the wells serve to collect these materials, NAPL thickness measurements in groundwater monitoring wells are typically greater than the actual thickness of NAPL in the surrounding formation.

Consistent with previous events, measurable NAPL was only detected in GZ-307S during this annual monitoring period. However, evidence of dull sheen was observed on purge water from monitoring wells GZA-201, well GZ-319D had an oil-like odor and wells RCA-1 and RCA-15 had a rust-like color on the purge water during the November 2021 groundwater sampling event. Refer to groundwater sampling logs in **Appendix B** (*Groundwater Sampling Low Flow Logs)* for additional information.

The following tables were prepared to present gauging data collected:

- **Table 2** (*Summary of Groundwater and NAPL Gauging Results);*
- **Table 3** (*Historical Light Non-Aqueous Phase Liquid (LNAPL) Well Gauging Data);*
- **Table 4** (*Historical Dense Non-Aqueous Phase Liquid (DNAPL) Well Gauging Data);* and

- **Table 5** (*LNAPL Gauging and Recovery – GZ-307S).*

2.2.1 LNAPL Observations and Recovery

Observations of LNAPL in groundwater monitoring wells has been limited to certain isolated areas of the Site, generally in areas that were formerly utilized for gas manufacturing. As indicated in **Table 2** and **Table 3**, between November 2001 and November 2021, only fifteen (15) of the wells had product present at greater than or equal to 0.01 feet. These well locations are presented on **Figure 6** (*Historical NAPL Thickness (≥0.01 feet) (2001-2021))*. The majority of LNAPL detections were less than 0.40 feet in thickness.

GZA-307S was the only monitoring well to contain trace to measurable LNAPL in 2021 as presented in **Table 5**. GZ-307S was installed in 2014 to delineate the extent of LNAPL observed along the northern property line. Observations of LNAPL at this well location are performed on an approximate monthly basis. During 2021, trace to 0.03 feet of LNAPL was detected in this well during the monthly gauging events (refer to Table 5), with the exception of the November monthly gauging, which no LNAPL was detected within the well. Due to the limited thickness (less than 0.1 feet), no measurable quantity of LNAPL/groundwater mixture was recovered from GZ-307S during 2021.

2.2.2 DNAPL Observations

As indicated in **Table 2** and **Table 4**, between November 2001 and November 2021, DNAPL was encountered in only one (1) monitoring well (RCA-3), located in the north-central portion of the Site proximate to the cove, as shown on **Figure 3B**. With the exception of 0.17 feet detected in November 2001, DNAPL observations at this location have been limited to trace amounts. In 2014, a deeper monitoring well was installed (GZ-313D) near the location of RCA-3 to assess the vertical extent of DNAPL in this area. DNAPL was not encountered in GZ-313D between 2014 and 2016. Both RCA-3 and GZ-313D were decommissioned in July 2016. DNAPL was not encountered in any remaining monitoring wells in 2021.

2.3 NEW MONITORING WELL INSTALLATION

Five (5) monitoring wells (GZ-500S, GZ-500D, GZ-501S, GZ-502S, and GZ-503S) were installed on Site from September 14 to September 15, 2021 by New England Geotech via geoprobe drilling techniques, to replace the seven (7) monitoring wells within the former Holder 18/21 area (RCA-11, VHB-8R, VHB-10, VHB-18, GZ-320D, GZ-401, and GZ-403) and to supplement existing monitoring well coverage at the Site.

Monitoring wells (GZ-500S, GZ-501S, GZ-502S) were installed on September 14, 2021, and monitoring wells (GZ-500D and GZ-503S) were installed on September 15, 2021. Wells were constructed of 2-inch diameter Schedule 40 PVC in accordance with the standards specified in Rhode Island Water Quality Regulations (https://rules.sos.ri.gov/regulations/part/250-150-05-3). Strategic Environmental Services assisted New England Geotech by providing soil vactor truck excavation at the areas of well installation.

Newly installed wells were developed (removal of sediment build-up within the well) by GZA on September 22, 2021. The development process was performed via repetition of surging a bailer through the length of the well screen and pumping out standing groundwater. When the well was dried, it was allowed to recharge, and the process was repeated until water quality was reasonably non-turbid. Debris from development activities were containerized in an existing Oily Debris drum located in Compressor House #2. Two (2) 55-gallon drums of purge water were generated from well development activities and were transported off Site for disposal at the Clean Harbors facility in Bristol, Connecticut by Clean Harbors. A copy of the disposal manifest is provided in **Appendix C** *(Investigation Derived Waste (IDW) Shipping Records)*.

Dull sheen was observed in purge water from monitoring wells GZ-500S, GZ-500D, GZ-501S and GZ-503S. The purge water generated from GZ-503S was also observed to have a petroleum-like sheen. Approximately 1/2-gallon of purge water was developed from GZA-503S due to shallow standing water in the well and a slow recharge. Geoprobe logs from the new monitoring well installation are provided in **Appendix E** (*New Monitoring Well Installation)* for additional information.

2.4 GROUNDWATER FLOW DIRECTION

Comprehensive elevation gauging rounds of the groundwater monitoring well network were performed in June 2021 and November 2021. These depths to groundwater readings were used to calculate the elevation of the groundwater table at each well location. Monitoring well reference elevation and depth to groundwater measurements are presented in **Table 2**. **Table 2** also includes groundwater elevation data collected by GZA since July 2011 during our initial assessment of well conditions at the Site. The comprehensive groundwater elevations recorded during the November 2021 gauging round were used to prepare the shallow groundwater contours presented on **Figure 5.**

Site groundwater elevations are tidally influenced and have been observed to fluctuate approximately 3 feet between mean low and mean high water. Groundwater was encountered in many of the explorations at the Site at depths ranging from approximately 3 to 13 feet bgs (ranging from elevation 7 feet NAVD 88 to 1 feet NAVD 88), with shallower groundwater being encountered close to the Providence River at the LNG Facility. Shallower groundwater was also encountered proximate to the northern Site boundary in the Natural Gas Regulation Facility. Groundwater in this area is likely influenced by utility corridors. As presented on **Figure 5**, groundwater beneath the Site flows from west to east towards the Providence River, consistent with surrounding topography.

2.5 GROUNDWATER SAMPLING TECHNIQUES

As shown on **Figure 4**, the groundwater monitoring well network consisted of thirty-six (36) groundwater monitoring wells in 2021. In November 2021, groundwater quality samples were collected from seventeen (17) monitoring wells: RCA-1, RCA-12R, RCA-15, RCA-22, RCA-31, RCA-36, VHB-1, VHB-20, GZA-201, GZ-301D, GZ-304D, GZ-309D, GZ-319D, GZ-500S, GZ 500D, GZ-501S, and GZ-502S. These well locations were chosen to provide a representative evaluation of overall Site groundwater quality.

During the November 2021 round, groundwater samples were collected in general accordance with EPA's September 19, 2017, Low Stress (low flow) Purging and Sampling Procedure. Prior to sampling, the depth to static groundwater and any NAPL present was measured in each well using an ORS electronic oil/water interface probe. During groundwater sampling, a variable speed peristaltic pump was utilized to control the rate of purging. Dedicated 1/4-inch polyethylene tubing installed in each of the existing wells was utilized as the intake and discharge tubing for the pumps. This tubing has the potential to become brittle when exposed to UV light (sunlight) and where necessary this tubing is typically replaced. No tubing needed replacement during the November 2021 sampling round due to sunlight exposure. Groundwater sampling logs are included in **Appendix B**. Pharmaceutical grade tubing was utilized as the pump head tubing and connected to the intake and discharge tubing by clamps sufficient to prevent the introduction of air into the sample. If NAPL was noted in the monitoring well prior to sampling, new tubing was installed in the monitoring well. In order to limit the potential for LNAPL to enter the sampling tubing during the collection of the sample, a peristaltic pump was used to force air through the tubing as it passed through the LNAPL/groundwater interface. If DNAPL was noted in the well, the sampling tubing was installed in these wells carefully so that the DNAPL layer was not intercepted.

During sampling, field readings were recorded for pH, temperature, specific conductance, oxidation reduction potential (ORP) and dissolved oxygen (DO) using a YSI Professional Plus® portable water quality meter with a flow-through cell. A LaMotte Turbidimeter® was used to monitor the turbidity. These field readings are presented in the field sampling logs, attached as **Appendix B**. As indicated on the logs, the monitoring wells were generally pumped until field screening parameters were stabilized prior to collecting the samples.

All recovered groundwater was collected and containerized in an appropriately labeled 55-gallon drums or other equivalent container for off-Site disposal. Copies of disposal documentation are provided in **Appendix C.**

Samples were placed in laboratory-provided, hydrochloric acid-preserved 40 mL glass vials with septa caps for VOC analysis via EPA Method 8260B. Samples were then packed in an ice chest and transported under chain-of-custody protocol to ESS Laboratory located in Cranston, Rhode Island.

The analytical results from these groundwater monitoring activities are provided in **Appendix D** (*Laboratory Reports)* and **Table 6 (***Summary of 2021 Groundwater VOC Analytical Results)*.

QA/QC samples were also collected and analyzed during these groundwater sampling activities. These QA/QC procedures and samples are summarized below in Section 2.6.

2.6 QUALITY ASSURANCE/QUALITY CONTROL SAMPLING AND ANALYSIS

During the November 2021 sampling round, all groundwater samples were submitted to ESS Laboratory in Cranston, Rhode Island for analysis. The samples were transported to the laboratory under chain of custody protocol.

Field duplicate samples were collected and analyzed to evaluate the reproducibility of the sampling methods. Duplicate groundwater samples were collected sequentially after achieving stabilization of the geochemical parameters. Duplicate samples were collected at a frequency of 1 duplicate sample per 20 samples collected on average. Duplicate groundwater sampling results are included in the applicable summary table, with a reference to the applicable sample location in the notes section. A VOC trip blank accompanied each cooler of groundwater samples on November 17 and 18, 2021 to the laboratory and was analyzed for the presence of VOCs to evaluate potential cross contamination during sample transport. In error, a trip blank was not submitted with groundwater samples submitted to the lab with the samples collected on November 16, 2021.

The analytical results and chain-of-custody forms are presented in **Appendix D** and **Table 7** (*Summary of Groundwater QA/QC VOC Analytical Results)*.

The following summarizes the groundwater QA/QC samples for the 2021 sampling event:

QA/QC Sample Type	Matrix	Number of Samples	Analysis / Comment
Samples	Groundwater	17	VOCs
Field Duplicates	Groundwater	1	VOCs
Trip Blanks	Groundwater	2	VOCs

Upon receipt, GZA audited the analytical data to assess whether the analytical data met the data quality objectives of the project. This audit included evaluation of QA/QC samples (*e.g.*, Lab Control Samples/Lab Control Sample Duplicates, Method Blanks, Field Blanks, and Field Duplicates) to evaluate the representativeness, comparability, completeness, precision, accuracy, and sensitivity of the analytical data.

The groundwater analytical results were generally useable to meet the project data quality objectives with no unusual observations noted.

2.7 GROUNDWATER ANALYTICAL RESULTS

Analytical data from the sampling event is summarized in **Table 6** and **Figure 7**. The table includes comparisons to Method 1 (or Method 2 as appropriate) GB Groundwater Objectives and Upper Concentration Limits (UCL). In general, the analytical results reported during the 2021 round was consistent with levels detected previously.

Historical groundwater quality at the Site has generally characterized by a few isolated exceedances of the GB Groundwater Objectives for benzene, ethylbenzene and naphthalene[1], primarily in areas of the Site where former MGP features were located. During the 2021 sampling round, all the detected compounds were below the GB Groundwater Objectives except for RCA-22,

[1] As noted in previous reports, vinyl chloride was also detected in a few Site wells in excess of the GB Groundwater Objective. Vinyl chloride is not a Site compound of concern and is likely originating upgradient of the Site.

in the LNG facility which had a measurable level of benzene (0.821 mg/L), above the criteria of 0.14 mg/L. No groundwater samples were collected from the Holcim Cement Facility portion of the Site[2]. In addition, no GB UCL exceedances were detected.

The following sections discuss the dissolved-phased VOC analytical results for this sampling event as compared to the Method 1 (or Method 2 as appropriate) objectives by Site area.

2.7.1 Former CNG Fueling Station

The Former CNG Fueling Station area is primarily grassed with a smaller portion of paved area. The Former CNG fueling station and Former CNG buildings previously located in this area were removed in 2020 as part of the Former CNG Dispensing Station Demolition Project. Four (4) wells are located in this area (RCA-12R, GZ-301D, GZ-302S and GZ-302D). Two (2) monitoring wells (RCA-12R and GZ-301D) were sampled from this area during the 2021 monitoring event, as shown on **Figure 7,** with results presented in **Table 6.**

The following VOCs were detected in the sample collected from RCA-12R in the Former CNG Fueling Station area during the 2021 sampling round: cis-,1,2-dichloroethene (0.0074 mg/L), tetrachloroethene (0.0018 mg/L), and trichloroethene (0.0078 mg/L). All of the VOC results in the sample collected from GZ-301D were below the method detection limit. No VOCs were detected above the GB Groundwater Objectives.

Historically, exceedances of the Method 1/2 GB Groundwater Objectives in this area have been limited to vinyl chloride in samples collected from RCA-12R and GZ-301D. These monitoring wells are located proximate to Allens Avenue and the property line and groundwater contours (**Figure 5***)* indicate that groundwater flow originates upgradient. Additionally, the above detection of cis-1,2-dichloroethene, tetrachloroethene and trichloroethene are not compounds typically associated with former MGP operations. Therefore, these chlorinated VOC detections are likely due to upgradient sources.

2.7.2 Natural Gas Regulation Area

The Natural Gas Regulation Area is covered primarily by grasses or crushed stone, with some paved areas such as the parking lot and roadways. The gas operations building, Compressor Building No.2 and active natural gas regulator buildings are located in this area. Eighteen (18) wells are located in this area (RCA-1, RCA-15, RCA-17, VHB-1, GZ-303S, GZ-303D, GZ-304D, GZ-305S, GZ-306S, GZ-307S, GZ-308S, GZ-309D, Unknown-2, GZ-500S, GZ-500D, GZ-501S, GZ-502S, and GZ-503S). Nine (9) monitoring wells (RCA-1, RCA-15, VHB-1, GZ-304D, GZ-309D, GZ-500S, GZ-500D, GZ-501S, and GZ-502S) were sampled from this area during the November 2021 monitoring event (refer to **Table 6** and **Figure 7**).

VOCs were detected in seven (7/9) samples collected in the Natural Gas Regulation Area during the 2021 sampling round (RCA-1, VHB-1, GZ-304D, GZ-500D, GZ-500D, GZ-501S, and GZ-502S). The following VOCs were detected: benzene, cis-1,2-dichloroethene, sec-butylbenzene, 1,3,5-trimethylbenzene, 1,2,4-Trimethylbenzene, 4-isopropyltoluene, carbon disulfide, ethylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, isopropylbenzene, styrene, toluene, trichloroethene and xylenes. None of the VOCs detected were above the applicable GB Groundwater Objectives.

Historically, few isolated exceedances of the Method 1/2 GB Groundwater Objectives for benzene and naphthalene have been detected in the Natural Gas Regulation Area in areas where former MGP features were located: downgradient of former tar/ammonia pits (VHB-7), proximate to the former gasholder No. 18 (VHB-10) and downgradient of the former ammonia works buildings (VHB-21/GZ-318D). The presence of these compounds in groundwater samples is typical for former MGP sites.

Also, compounds such as 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, 4-isopropyltoluene, carbon disulfide, ethylbenzene, n-butylbenzene, n-propylbenzene, styrene, toluene, trichloroethene and xylenes were mostly detected in the newly installed wells during the 2021 sampling event at very low concentrations (slightly above the method detection limits). The presence of

[2] Note that there are no active monitoring wells located within the Holcim Cement Facility.

these compounds in groundwater samples is not typical of former MGP sites; GZA will continue to monitor these concentrations in the future.

2.7.3 LNG Facility

The LNG Facility area is covered with concrete, crushed stone or asphalt areas. The LNG tank, LNG fueling station and LNG facility control buildings are located in this area. Fourteen (14) wells are located in this area (RCA-6, RCA-22, RCA-28, RCA-31, RCA-34, RCA-36, VHB-20, GZ-101, GZ-201, GZ-319D, ESS RW-3, ESS RW-4, ESS RW-5 and ESS RW-6). Six (6) monitoring wells (RCA-22, RCA-31, RCA-36, VHB-20, GZ-201 and GZ-319D) were sampled from this area during the November 2021 monitoring event, as summarized in **Table 6** and presented on **Figure 7**.

VOCs were detected in five (5/6) samples collected in the Natural Gas Regulation Area during the 2021 sampling round (RCA-22, VHB-20, RCA-36, GZ-201 and GZ-319D). The following VOCs were detected: 1,2,4-trimethylbenzene, benzene, ethylbenzene, isopropylbenzene, naphthalene, n-butylbenzene, n-propylbenzene, sec-butylbenzene, styrene, toluene and xylenes. RCA-22 was the only well with VOCs detected at concentrations that exceed the applicable Method 1/2 GB Groundwater Objectives. At this location, benzene was detected at a concentration of 0.821 mg/L, above the GB Groundwater Objective of 0.14 mg/L.

Historically, few isolated exceedances of the GB Groundwater Objectives for benzene, ethylbenzene and naphthalene have been detected in the LNG Facility in areas of the Site where former MGP features were located: proximate to the former purifier building (RCA-28) and proximate to former MGP features (RCA-22, RCA-36, GZ-314S/D and GZ-315D). The presence of these compounds in groundwater samples is typical for former MGP sites.

2.8 INVESTIGATION DERIVED WASTE MANAGEMENT

All groundwater generated during monitoring activities performed in 2021 were placed into 55-gallon drums for subsequent off-Site disposal. The resulting drums were labeled and temporarily stored on-Site. All IDWs removed from Site up to this point in time (August 2022) were transported off-Site by CHES to their facility in Bristol, CT and El Dorado, AR. Copies of shipping records for the IDWs are included in **Appendix C**.

3.0 SUMMARY AND CONCLUSIONS

As part of the annual Site monitoring events in 2021, seventeen (17) monitoring wells were sampled in November 2021 for VOCs; all accessible wells were gauged to determine the groundwater elevation and presence of NAPL on an approximate semi-annual basis; and shoreline observations were made on an approximately monthly basis throughout the year. In general, observations made, and the results of analytical testing were consistent with historical results, as summarized below:

- Sheen observations were consistent with historical observations and were limited to the cove in the northwestern portion of the Site. Sheen observations were limited to several localized and immediate areas of the shoreline and were observed at various tidal stages, with most observations at mid-tide.

- NAPL Observations:

    - Trace amounts to up to 0.03 feet of LNAPL was detected in GZ-307S during 2021, with the exception of the November monthly gauging when no LNAPL was detected within the well. NAPL recovery was not attempted at monitoring well GZ-307S during 2021 because of the limited thickness of NAPL detected.

    - Observations of both LNAPL continue to be very localized and do not indicate the presence of significant contiguous source layers in the subsurface.

- Groundwater Quality:

    - Historical groundwater quality at the Site is generally characterized by a few isolated exceedances of the GB Groundwater Objectives for benzene, ethylbenzene and naphthalene, primarily in areas of the Site where former MGP features were located. The presence of naphthalene, benzene and ethylbenzene in groundwater samples is typical for former MGP sites.

    - Only one well (RCA-22 in the LNG facility) had an exceedance of the GB Groundwater Objective during the 2021 monitoring period. At this well, benzene was detected at a concentration of 0.821 mg/L, above the criteria of 0.14 mg/L.

    - Several VOCs were detected at low concentrations during the 2021 sampling event, primarily in the newly installed wells. The detected VOCs included the presence of 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, 4-isopropyltoluene, carbon isulfide, ethylbenzene, n-butylbenzene, n-propylbenzene, styrene, toluene, trichloroethene, and xylenes. While detected at low concentrations (generally slightly above the detection limits and well below the applicable criteria), many of these compounds are not typical chemical of concerns at former MGP sites. GZA will continue to monitor the presence of these compounds during future sampling events.

1. This table shows observations that were made along the Site shoreline. Observations were made at least monthly.
2. A water line directly proximate to the Providence River at the LNG facility unexpectedly failed on May 31, 2013. This water line provided fire protection for the LNG facility. Immediate response actions included deploying additional absorbent booms, repairing a rip-rap slope and temporarily repairing the line for fire protection. The water line was replaced in the fall of 2013. Additional boom was deployed on May 31, 2013 and June 3, 2013

LIMITATIONS

GEOHYDROLOGICAL LIMITATIONS

1. This *Groundwater Monitoring Report* has been prepared on behalf of and for the exclusive use of The Narragansett Electric Company d/b/a National Grid, solely for use in documenting the conditions observed at the property located at 642 Allens Avenue in Providence, Rhode Island ("Site"). This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, nor used by any other party in whole or in part, without the prior written consent of GZA or National Grid.

2. GZA's work was performed in accordance with generally accepted practices of other consultants undertaking similar studies at the same time and in the same geographical area, and GZA observed that degree of care and skill generally exercised by other consultants under similar circumstances and conditions. GZA's findings and conclusions must be considered not as scientific certainties, but rather as our professional opinion concerning the significance of the limited data gathered during the course of the study. No other warranty, express or implied is made. Specifically, GZA does not and cannot represent that the Site contains no hazardous material, oil, or other latent condition beyond that observed by GZA during the performance of our Site investigations.

3. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based upon services performed and observations made by GZA.

4. In the event that National Grid or others authorized to use this report obtain information on environmental or hazardous waste issues at the Site not contained in this report, such information shall be brought to GZA's attention forthwith. GZA will evaluate such information and, on the basis of this evaluation, may modify the conclusions stated in this report.

5. The conclusions and recommendations contained in this report are based in part upon the data obtained from environmental samples obtained from relatively widely spread subsurface explorations. The nature and extent of variations between these explorations may not become evident until further exploration. If variations or other latent conditions then appear evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

6. The generalized soil profile described in the text is intended to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized and have been developed by interpretations of widely spaced explorations and samples; actual soil transitions are probably more gradual. For specific information, refer to the boring logs.

7. In the event this work included the collection of water level data, these readings have been made in the test pits, borings and/or observation wells at times and under conditions stated on the exploration logs. These data have been reviewed and interpretations have been made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall and other factors different from those prevailing at the time measurements were made.

8. The conclusions contained in this report are based in part upon various types of chemical data and are contingent upon their validity. These data have been reviewed and interpretations made in the report. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by GZA and the conclusions and recommendations presented herein modified accordingly.

REVIEWED
By ESS Laboratory at 3:32 pm, Nov 23, 2021

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

REVIEWED
By ESS Laboratory at 6:07 pm, Nov 24, 2021

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

REVIEWED

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

REMARKS

1 - The upper 6 feet was cleared utilizing a soil vacter truck.
2 - The headspace of soil samples was screened for total organic compounds (TVOCs) using a miniRae 3000 photo-Ionization detector (PID) equipped with a 10.6 eV lamp calibrated to a 100 ppm isobutylene standard.
3 - Water table observed at approximately 8 feet below ground surface.
4 - A groundwater monitoring well of the following construction was installed 10 feet of 2" diameter, schedule 40, flush joint, threaded, 10-slot, PVC well screen at 30 feet below ground surface, 2" diameter schedule 40, flush joint, threaded PVC riser installed approximately from 20 feet below ground surface to 3 feet above ground surface. Filter sand placed in annulus from 20-30 feet below ground surface. Bentonite seal installed from 19-20 feet below ground surface. Remaining annulus filled with filter sand. Well protected with stand pipe.

Field Screening performed with PID equipped with a 10.6 eV lamp calibrated to a 100 ppm isobutylene standard.See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

REMARKS

1 - The upper 6 feet was cleared utilizing a soil vacter truck.
2 - The headspace of soil samples was screened for total organic compounds (TVOCs) using a miniRae 3000 photo-Ionization detector (PID) equipped with a 10.6 eV lamp calibrated to a 100 ppm isobutylene standard.
3 - Water table observed at approximately 8 feet below ground surface.
4 - A groundwater monitoring well of the following construction was installed 10 feet of 2" diameter, schedule 40, flush joint, threaded, 10-slot, PVC well screen at 15 feet below ground surface, 2" diameter schedule 40, flush joint, threaded PVC riser installed from approximately 5 feet below ground surface to 3 feet above ground surface. Filter sand placed in annulus from 5-15 feet below ground surface. Bentonite seal installed from 4-5 feet bgs. Remaining annulus filled with filter sand. Well protected with a stand pipe.

Field Screening performed with PID equipped with a 10.6 eV lamp calibrated to a 100 ppm isobutylene standard.See Log Key for explanation of sample description and identification procedures. Stratification lines represent approximate boundaries between soil types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.
